1   Welcome

This manual provides a basic overview of installing and using 20-sim. It is not a reference manual but intended as a guided tour to show you how to use 20-sim and how to create and simulate your own models.

If you need detailed information on 20-sim please have a look at the the Reference Manual.

If you are a first time user you are advised to read this manual carefully and run the various examples to get hands on experience with the package.

- **Installation**: This chapter describes the various versions of 20-sim and how to install 20-sim on your computer. It is useful for system managers and if you experience problems installing the package. You may skip this chapter if 20-sim is properly working on your computer.
- **Introduction**: This chapter describes the basic parts of the 20-sim package, the modeling representations that are supported and the various toolboxes. It gives a good overview of the package. Users who want to learn the package by trial and error.
- **Equation Models**: No one should skip this chapter! It describes the basic modeling representation of 20-sim: (differential) equations. You should run the examples of this chapter to get a good understanding of entering equations in 20-sim.
- **Block Diagram Models**: Extremely recommended once you have finished the equations. Everyone will now and then use block diagram elements and in this chapter you can learn all about this modeling representation.
- **Iconic Diagrams**: Iconic diagrams or physical components are the building blocks of models of physical systems. This chapter is absolutely worth reading for everyone who is involved in modeling physical systems.
- **Bond Graphs**: Bond graphs are a mathematical notation of physical systems. 20-sim has a large library of bond graph elements. This chapter does not explain bond graphs but how to use 20-sim to enter bond graph models.
- **3D Mechanics Toolbox**: The 20-sim 3D Mechanics Toolbox provides you with the tool that makes 3D dynamic modeling easier, the 3D Mechanics Editor.
- **Animation Toolbox**: The Animation Toolbox offers you an easy way to create 3D Animations and view graph animations.
- **Control toolbox**: The Control Toolbox of 20-sim contains several tools that can aid you in developing controllers for your modeled machines, the Controller Design Editor, the Filter Editor and the Neural Network Editors.
- **Frequency Domain Toolbox**: The 20-sim Frequency Domain Toolbox consists of the Linear System Editor, FFT Analysis and Model Linearization functionality.

- **Mechatronics Toolbox**: The Mechatronics Toolbox includes the Motion Profile Wizard, the CAM Wizard and the Servo Motor Editor.
- **Real Time Toolbox**: The Real Time Toolbox provides you with C-code generation tools and templates for all kinds of different targets and platforms.
- **Time Domain Toolbox**: During simulation, the time domain behavior of a model is calculated. Based on this time-domain behavior, the model can be analyzed. A set of powerful methods for time domain analysis is available in 20-sim.
- **Scripting Toolbox**: This chapter contains a description of the scripting functionality that allows you to automate tasks with 20-sim using Octave, Matlab or Python.
- **20-sim Unity Toolbox**: This chapter contains a description of the new 20-sim Unity Toolbox functionality that allows you to use Unity 3D animations together with 20-sim.

2   Notation

In the 20-sim manual the following typographic notations are used:

- User instructions are numbered:

    1. Open the Simulator and start a simulation run.

- Specific 20-sim menus and menu commands are in bold:

    The simulator can always be started by the **Start Simulator** command from the **Model menu**.

- Files and directories are written in italic type:

    The file *ScaraRobot.emx* is located in *C:\Program Files\20-sim 5.0\Models\Examples \2D Mechanics* (or on 64-bit systems: *C:\Program Files (x86)\20-sim 5.0\Models \Examples\2D Mechanics)*.

- 20-sim commands, windows and window parts are started with an uppercase character and written in italic type:

    Drag and drop the model from the *Library Browser* to the *Graphical Editor*.

- Parameters, variables and other specific 20-sim elements are written in italic type:

    In the equation model the function *abs* is used to make the signal *output* equal to the absolute value of sum of variable *offset* and the signal *input*.

3 Installation

3.1 Versions

20-sim is available in two versions: Viewer and Professional.

- **Viewer/Demonstration version**: This is a freeware version that allows you to load and run models and evaluate the package. Saving of models is not possible in this version.
- **Personal**: This version is for use at home, for students and personal education. Not for commercial, government, academic or other organizational use. This is the full version of 20-sim with standard toolboxes.
- **Professional**: This is the full version of 20-sim with standard toolboxes.

Next to the standard toolboxes that come built-in with 20-sim, additional toolboxes can be purchased. The table below shows in detail the options that are available:

20-sim with standard toolboxes	Viewer	Personal	Professional
Library Models	v *	v	v
Number of Variables	unlimited	< 200	unlimited
Number of Equations	unlimited	< 200	unlimited
3D Mechanics Toolbox	v *	v	v
Animation Toolbox	v *	v	v
Control Toolbox	v *	v	v
Frequency Domain Toolbox	v *	v	v
Scenario Manager	x	v	v
Mechatronics Toolbox	v *	v	v
Real Time Toolbox	v *	v	v
Time Domain Toolbox	v *	v	v
Scripting Toolbox	x	v	v
Additional toolboxes			
20-sim Unity Toolbox	x	x	p

v = included
p = has to be purchased separately
v* = included but no saving possible
x = not available

20-sim is installed, using an Installation Manager that will lock 20-sim to your computer. There are three types of licenses available:

- **Free :** The demonstration version comes with a license that is not locked to your computer. No actions have to be taken after installation of the program.
- **Single License:** A single license locks 20-sim to a specific computer. After installation you have to register to get a valid license.
- **Floating License:** A floating license allows multiple users to work with 20-sim at the same time. After installation you have to register to get a valid license.

3.2 Requirements

20-sim is guaranteed to work on computers that will meet the following requirements:

- Operating System: Windows 7, 8, 8.1, 10, 11.
- Processor requirements: 20-sim requires a CPU with SSE2 support. Supported: Intel Pentium 4 and above, AMD Athlon x64 and above.
- Available Disk Space: 690 MB.

3.3 Installing 20-sim

20-sim can be downloaded from the website www.20sim.com. This is an installation file that will install 20-sim on your computer. The first 4 steps are equal for all users. Depending on the type of license (single, floating) you have to continue differently.

1. **Install 20-sim** and **start** the program.

2. During Installation you will be asked to install the (optional) **Python 3.7 package**. We advise to keep the default setting: **Yes**.

3. **Start** 20-sim (from the **Windows Start Menu** choose **20-sim 5.0**).

If a valid license of 20-sim 5.0 was activated before, the program will start automatically and you can skip the rest of this section. If you have not installed 20-sim before, the *License Activation* dialog will open. You can also manually open the *License Activation* dialog:

4. From the **Help** menu select **License Activation**.

Use the Registration/Update window to request for a license.

5. If you have a valid license key or license file, press the **Activation** button to enter your license key or browse for the license file.

If you do not yet have a valid license, press the **Trial License** button request an trial license or press the **Buy** button to purchase a license. If you want to continue in *Viewer* mode (no save functionality), just close the dialog without activating 20-sim.

6. Select **which kind of license** you have and **who** should use the license.

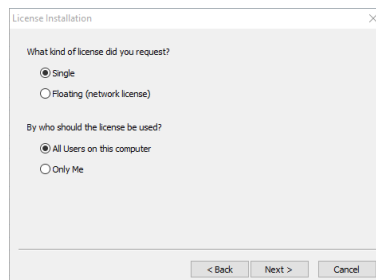

License installation dialog.

Single License

If you are using a single license, you have to enter a license key or license file.

7. On the next dialog, select *I received a license key by e-mail* and enter the **key** in the next dialog. When you received a **license file**, you have to enter the **location** of the license file.
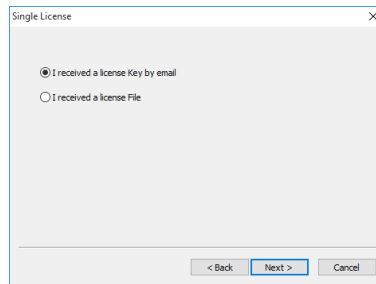

Single License dialog.

You will be asked for confirmation (click **Activate Now**) and activation will be carried out. After a successful activation process the License Information dialog will show the new license.

Web Activation dialog.

Floating License

Installing a floating license (Administrator)

If you are using a license that is shared by more users (floating license, also known as concurrent license or server license), you have enter the received license key and a location on the server (a normal Windows shared folder) first. This location on the server should be accessible to all users and have read/write permission. The floating license will be stored at the selected location.

6. On the next dialog, select **First Installation** and then enter the **license key** and the **location on the server** (Windows share).

On the location that you have given, a license file *20sim.lic* will be installed. Remember the location of this file because every new user of 20-sim will need to enter it. You will be asked for confirmation (click **Activate Now**) and activation will be carried out. After a successful activation process the License Information dialog will show the new license.

Using a floating license (Other users, Administrator)

If you are using a floating license that was already installed you have to enter the location of the license file.

7. On the next dialog, select **Administrator already installed server license** and then enter the **license location** (i.e. location of the file *20sim.lic*).

After a successful entry of the location of the license location, the License Information dialog will show the new license.

3.4 Uninstalling

You can uninstall 20-sim by clicking the Uninstall command from the 20-sim start menu. Uninstalling of 20-sim will not deactivate your license. If you want to move 20-sim to another computer, you have to deactivate your license first before uninstalling.

3.5 Deactivation

If you want to move 20-sim to another computer, you have to deactivate your license before uninstalling the program. On the new computer you can then install the program and activate the license. To deactivate your license:

1. From the Windows **Start menu** open **20-sim**.

2. From the **Help** menu choose **License Activation**.

3. Press the **Activation** button.

4. Choose **Deactivate the License** and click **Finish**

You will be asked for confirmation and deactivation will start. After a successful deactivation, you version of 20-sim has turned into the demonstration version. You can now uninstall the software and reinstall it.

4   Introduction

4.1   What is 20-sim

20-sim is a modeling and simulation program that runs under Microsoft Windows. With 20-sim you can simulate the behavior of dynamic systems, such as electrical, mechanical and hydraulic systems or any combination of these.

20-sim fully supports graphical modeling, allowing to design and analyze dynamic systems in a intuitive and user friendly way, without compromising power. 20-sim supports the use of components. This allows you to enter models as in an engineering sketch: by choosing components from the library and connecting them, your engineering scheme is actually rebuilt, without entering a single line of math!

From the engineering sketch,
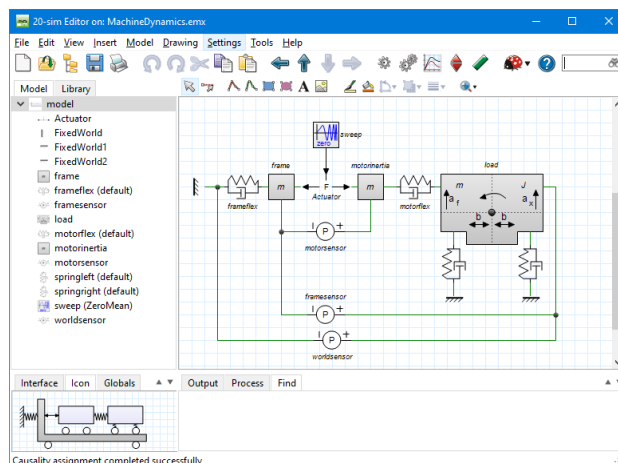

directly to a model, one on one!

4.2   20-sim: a quick tour

The best way to experience the capabilities of 20-sim is to open example models and run simulations. In this quick tour we will show you how to load models from the *Examples* library and run simulations.

1.   **Start** 20-sim.

20-sim consists of two main windows (*Editor* and *Simulator*) and a lot of tools. The *Editor* opens when you start 20-sim. In the *Editor* you can create your models.

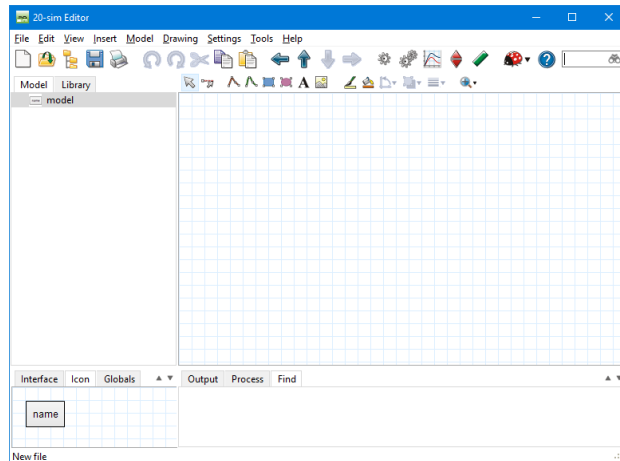

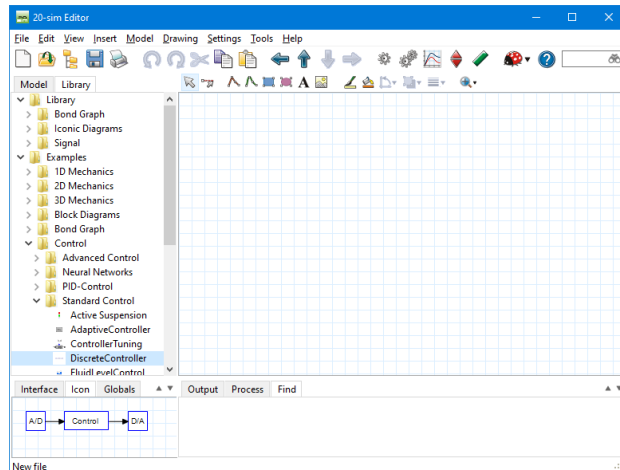

The 20-sim Editor.

The *Editor* consists of four parts:

- *Model tab / Library tab*: This is the part at the middle left. The *Model tab* shows the *model hierarchy*, i.e. the hierarchical composition (all the elements) of the model that is created in the *Editor*. The *Library tab* shows the 20-sim library.

- *Graphical Editor / Equation Editor:* This is the big white space at the middle right. In this editor you can create graphical models and enter equations.

- *Output tab / Process tab / Find tab:* This is the part at the bottom right. The *Output tab* shows the files that are opened and stored. The *Process tab* shows the compiler messages. The *Find tab* shows the search results.

- *Interface tab / Icon tab:* This is the part at the bottom left. The *Interface tab* shows the interface of a selected model. Double clicking it will open the *Interface Editor*. The *Icon* tab shows the icon of a selected model. Double clicking it will open the *Icon Editor*.

We will open the model *DiscreteController.em* from the *Examples\Control\Standard Control* folder.

2.   Select the **Library tab** to open the *Library Browser* (shows the 20-sim library).

3. In the *Library Browser* select **Examples** - **Control** - **Standard Control** - **Discrete Controller**. Your *Editor* should now look like:

The 20-sim Editor with the model library selected.

Note: All models in 20-sim are stored on file with the extension *.emx*. Library models can be found where 20-sim was installed, e.g. *C:\Program Files (x86)\20-sim 5.0 \Models*. The model *DiscreteController* is stored in: *C:\Program Files\20-sim 5.0 (x86) \Models\Examples\Control\Standard Control\DiscreteController.emx*

4. **Drag and drop** the *Discrete Controller* model to the graphical editor (large white area). Now the model is opened. Your *Editor* should look like:
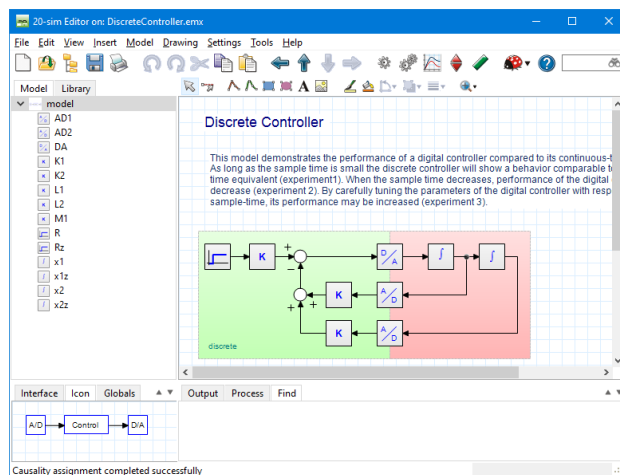

The 20-sim Editor with the model DiscreteController.emx loaded.

You can inspect the model by enlarging the *Editor* window or using the zoom button. We will continue the quick tour running a simulation.

5. In the **Model** menu select **Start Simulator**. Now the *Simulator* will be opened.
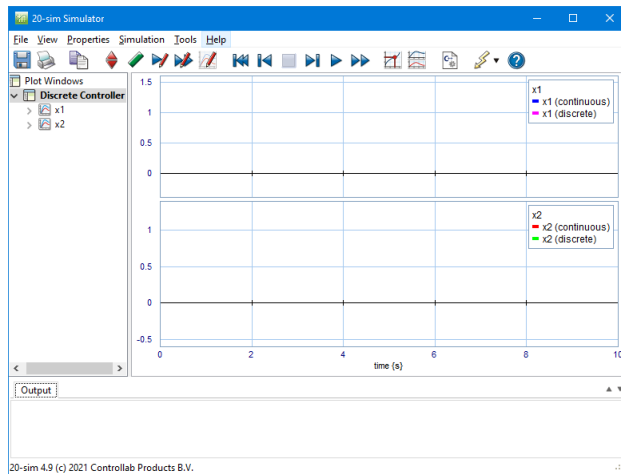

The 20-sim Simulator with the model DiscreteController.emx loaded.

In the *Simulator* you can run a simulation and show the results in plots and animations. The *Simulator* contains various tools to analyze the simulation results.

6. In the **Simulation** menu select **Run**. Now a simulation run will be performed. Your *Simulator* should look like:
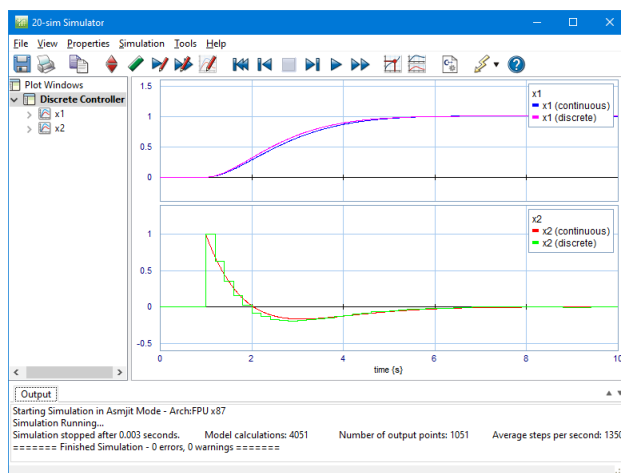

The 20-sim Simulator with the simulation results.

You have just learned how to open and run an example model. Try to load and run other models from the *Examples* library to find out more about the capabilities of the 20-sim package.

4.3   Library

In 20-sim, creating models only takes you just a few mouse clicks. By *dragging* an element from the library and *dropping* it in the graphical editor, your model is actually built the same way as you would draw an engineering scheme. 20-sim supports various model representations, such as block diagrams and iconic diagrams. These representations may be combined in one model.
Library Browser

All models in 20-sim are stored on files with the extension *.emx*. The standard libraries can be found in the 20-sim folder:

> *C:\Program Files\20-sim 5.0\Models*

or on 64-bit systems:

> *C:\Program Files (x86)\20-sim 5.0\Models*

This folder contains all the models that are visible in the *Library Browser* on the left part of the *Editor.*

You can find the library at the left of the Editor.

The library contains 3 sections with building blocks:
- *Bond Graph*: bond graph elements
- *Iconic Diagrams*: Physical components
- *Signal*: Block diagram elements

The library also contains 2 sections to help you getting used to 20-sim:
- *Examples*: example models that show you how to perform various tasks in 20-sim
- *Getting Started Manual*: all the models that you need in the lessons of the Getting Started manual.

Open Models

All library models are open source. You can inspect the content of any model in the *Editor*. If the model contains a hierarchy, you can use the *Go Down* command of the *Model* menu to descend in the hierarchy. If a model opens a specific editor, you can still inspect the underlying code by keeping the *shift key* pressed while clicking the *Go Down* command.

Custom Libraries

You can create your own model libraries in 20-sim:

1. From the **Tools** menu click **Options** - **Folders** - **Library Folders**.

2. Add your **folder.**

3. Give it a useful **name** by clicking **Edit Label**.

4. Click OK to close the dialog.

Then you can add your own library models to the library:

5. Select the **submodel** that you want to store in your library.

6. From the **File menu** select **Save Submodel**.

7. Store the submodel in your library **folder**.

The next time you start up 20-sim, the library will show the new submodel.

4.4   Block Diagrams

Block diagrams allow you to graphically represent the mathematical relationships between signals in a system. They are especially suited to model control systems. In 20-sim a large library of block diagram elements is available. The elements are displayed in the Editor by icons. You can create block diagram models by dragging the elements to the Graphical Editor and making the proper connections between the elements.

Library

20-sim has a large library of block diagram elements such as linear, non-linear, discrete and source elements. In 20-sim you can create custom made block diagram elements and add them to the existing libraries or combine them in newly defined libraries.
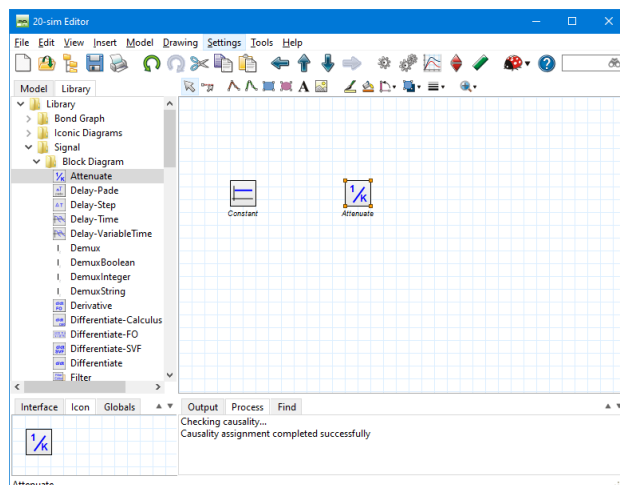

From the Library Browser (left) you can drag and drop elements into the Graphical Editor (right).

Signals

The foundation of block diagram elements is the use of input and output signals. 20-sim allows you to create user defined block diagram elements with an arbitrary number of input and output signals. Signal sizes can be 1 (default) or larger.

Custom Made Models

In 20-sim you can create your own block diagram elements and save them in your own model library. Models can have an arbitrary number of ports, input and output signals. A specialized drawing editor can be used to give the models any kind of representation.

4.5   Iconic Diagrams

Iconic diagrams or components are the building blocks of physical systems. They allow you to enter models of physical systems graphically, similar to drawing an engineering scheme. In 20-sim a large library of iconic diagram elements is available. The elements are displayed in the *Editor* by icons which look like the corresponding parts of the ideal physical model. You can create models by dragging the elements to the *Graphical editor* and making the proper connections between the elements.

Library

20-sim has a large library of iconic diagram elements such as electrical, hydraulic, mechanic and thermal models. In 20-sim you can create custom made iconic diagram elements and add them to the existing libraries or combine them in newly defined libraries.
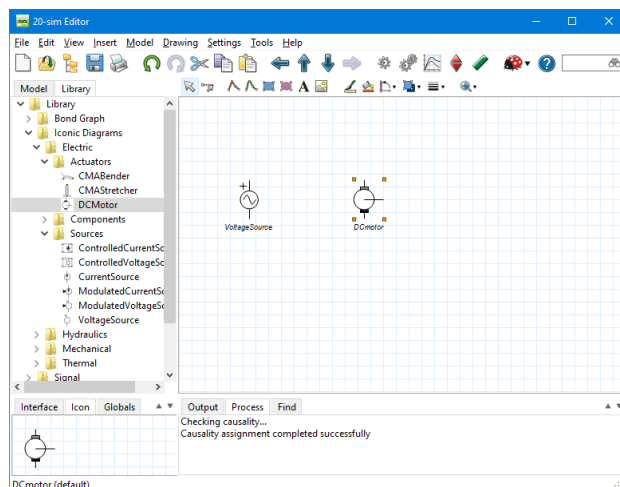

From the Library Browser (left) you can drag and drop elements into the Graphical Editor (right).

Ports and Multiports

The foundation of iconic diagram elements is the use of power ports. Power ports enable the connection between elements by describing the power flow between the elements. A power port consists of two signals which are called across and through. 20-sim allows you to create user defined iconic diagram elements with an arbitrary number of power ports. Port sizes can be 1 (default) or larger (multiports).

Algebraic Loops and Differential Causality

Algebraic loops and differential causalities are traced automatically. If possible, 20-sim will rewrite the equations symbolically to remove algebraic loops and differential causalities.

Custom Made Models

In 20-sim you can create your own iconic diagram elements and save them in your own model library. Models can have an arbitrary number of ports, input and output signals. A specialized drawing editor can be used to give the models any kind of representation.

4.6 Bond Graphs

20-sim was the first commercially released software package to support bond graph modeling. The first version of 20-sim with a bond graph library was released in 1995. Since then a continuous effort to improve bond graph modeling has made 20-sim the standard in bond graph modeling.

Bond Graphs

Bond graphs are a network-like description of physical systems in terms of ideal physical processes. With the bond graph method, the system characteristics are split-up into an (imaginary) set of separate elements. Each element describes an idealized physical process. To facilitate drawing of bond graphs, the common elements are denoted by special symbols.

Library

20-sim has a large library containing all standard bond graph elements. Next to standard elements, 20-sim supports custom user made bond graph models.

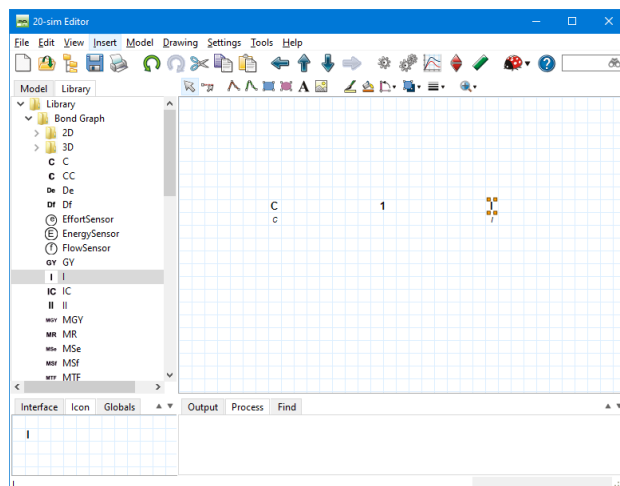

From the Library Browser (left) you can drag and drop elements into the Graphical Editor (right).

Ports and Multiports

The foundation of bond graph modeling is the use of power ports. Power ports form the connections with other bond graph elements and consist of two signals which are called effort and flow and multiply to power. 20-sim allows you to create user defined models with an arbitrary number of power ports and signals. Ports sizes can be 1 (default) or larger (multiports). For every port you can specify the causality as fixed preferred, indifferent or depending on the causality of other ports.

Causality

Causal strokes indicate the direction of the efforts and flows in a bond graph model. In 20-sim you have to enter the equations in one of the possible causal forms only. If causality is changed, the equations are rewritten automatically. 20-sim shows causal strokes in black color for preferred causality and in causal strokes in orange color for non-preferred causality. The Causality of a complete model is derived automatically but can be changed manually.
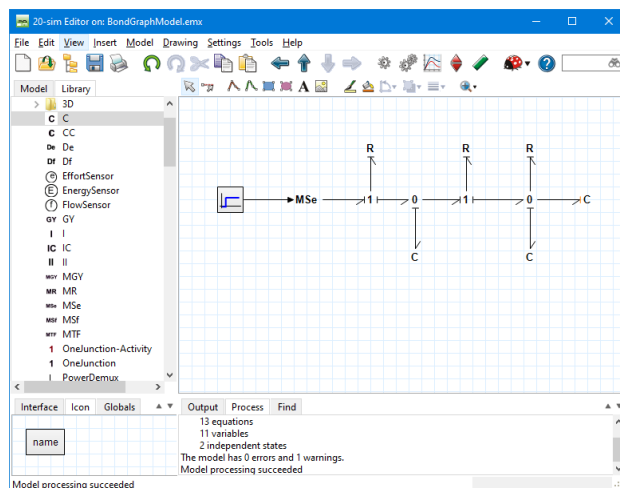

20-sim will assign causality automatically to your bond graph model.

Algebraic Loops and Differential Causality

Algebraic loops and differential causalities are traced automatically. If possible, 20-sim will rewrite the equations symbolically to remove algebraic loops and differential causalities.

Custom Made Models

In 20-sim you can create your own bond graph models and save them in a custom made model library. Models can have an arbitrary number of ports, input and output signals. A specialized drawing editor can be used to give the models any kind of representation.

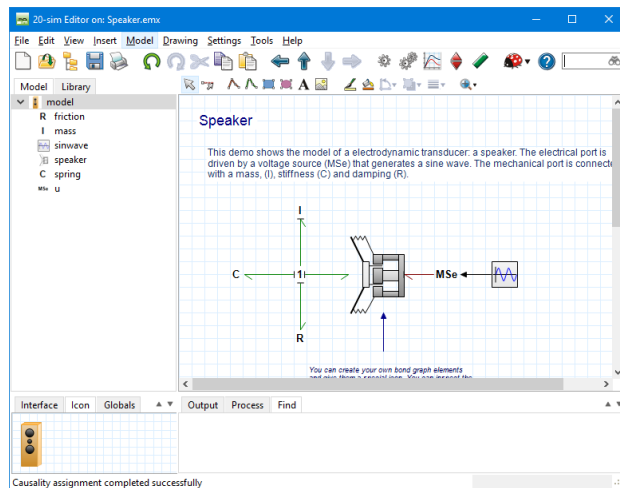

Create custom made bond graph elements.

4.7 Editor

Models are entered and compiled in the 20-sim *Editor*. The *Editor* is a versatile tool that helps you to enter models supporting a wide variety of systems including linear, non-linear, discrete-time, continuous-time and hybrid systems, without restricting the user to a certain model representation. After entering and debugging, the model can be checked and compiled. This is performed automatically in the background, when opening the *Simulator*.

Model Representations

Systems can be modeled in 20-sim, using equations, state space descriptions, bond graphs, block diagrams, and components or iconic diagrams. These descriptions can be fully coupled to create mixed models.

Open Source

20-sim models are stored in files. A *Library Browser* is part of the program, but you can also use the Windows Explorer for library management. All 20-sim models are open! You can drag and drop them from the library browser into the graphical editor to build new models. You are allowed to store the original and changed models in separate folders to create your own library of models.
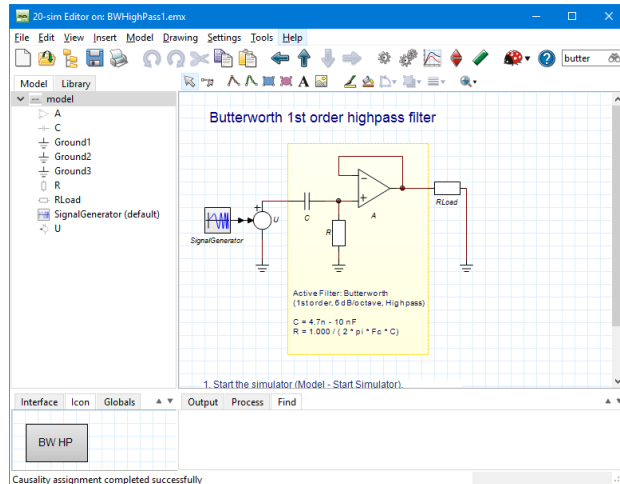

You can drag and drop models from the library browser to the graphical editor.

Debug Mode and Fast Mode

20-sim can operate in two modes: *Debug Mode* 🐞▾ and *Fast Mode* 🖊▾. This is indicated by the *Mode* button at the complete right of the toolbar. You can quickly change between these modes by clicking on the *Mode button*. In *Debug Mode* all possible checks will be performed and warnings will be generated for possible model errors. Always start modeling in *Debug Mode*!

Graphical Models

You can construct graphical models (block diagrams, iconic diagrams, bond graphs) by dragging and dropping models from the *Model Library* to the *Graphical Editor*. Default the Editor is in *Selection Mode* ▱. If you want to make connections between the models, you have to change to the *Connection Mode* ▱.

Drawing

The icon of every standard library model in 20-sim has been created using a special drawing editor: the *Icon Editor*. You can use the *Icon Editor* to change the standard library models or create your own library models. You can enter text and add bitmap pictures in every level of your model. With lines, arrows and other drawing objects you can enhance the understanding of your model.

Hierarchical modeling

20-sim supports unlimited hierarchical modeling. The highest levels consist of graphical models (state space models, block diagrams, bond-graphs or components) and the lowest level is formed by equations models.

Equations

The lowest level in a 20-sim model is formed by equations. Equations in 20-sim follow the standard mathematical notation and can be changed by the user. A large collection of linear, non-linear, scalar and matrix functions are available for the use in equations.

4.8   Variables, Parameters and Initial Values

Equations are the foundation for all models in 20-sim. At the lowest level of a model you will always find equations. Equations can be entered in the 20-sim *Editor*. An example equation model is shown below:

```
parameters
      real m = 1.0 {kg}; // mass
      real g = 9.8 {m/s2}; // gravity
      real K = 2.0 {N/m}; // spring constant
      real f = 1.0 {N.s/m}; // friction parameter
variables
      real v {m/s}; // velocity
      real interesting x {m}; // position
      real Fm {N}; // net-force applied to the mass
      real Fs {N}; // spring force
      real Fd {N}; // damper force
equations
      Fm = -m * g - Fs - Fd;
      v = ( 1/m ) * int( Fm , 0 );
      x = int( v , 0 );
      Fs = K * x;
      Fd = f * v;
```

A 20-sim equation model starts with the declaration of parameters and variables. In the *Equation* section, the equations are entered. An equation is simply a variable on the left part of the equal sign and variables or functions at the right side. During a simulation, the equations are calculated over and over again, many time steps, while the resulting variable values are be shown in plots.

You can inspect equations by opening an example model, select one of the blocks with you mouse pointer and select "Go Down "from the right mouse menu. If you repeat this you will always see an equation model at the lowest level.

Variables

Variables can change value during a simulation. You can inspect the current value of a variables in the Variables Chooser (Simulator - View - Variables).

Parameters

Parameters have a fixed value that you can change before a simulation in the Parameters/Initial Values Editor (Simulator - Properties - Parameters).

Initial Values

Some functions like an integral or a hold have an initial value. These initial values can be entered in the equation model (see int-function with a zero initial value in the example above: v = (1/m)*int(Fm , **0**)) or be changed before a simulation in the the Parameters/ Initial Values Editor (Simulator - Properties - Parameters).

4.9   Simulator

After entering a model in the *Editor* you can check and compile it. This is performed automatically in the background, when opening the *Simulator*. The *Simulator* is used for model simulation and analysis.

Plot Windows

Simulation results can be shown in plots and animations. These plots and animations can be part of the main *Simulator* window or additional windows. Plots are fully configurable. Logarithmic views, true-type fonts, line styles, marker styles and backgrounds are supported. Plots and animations can be made ready for publication easily (copy to clipboard and paste in any document).
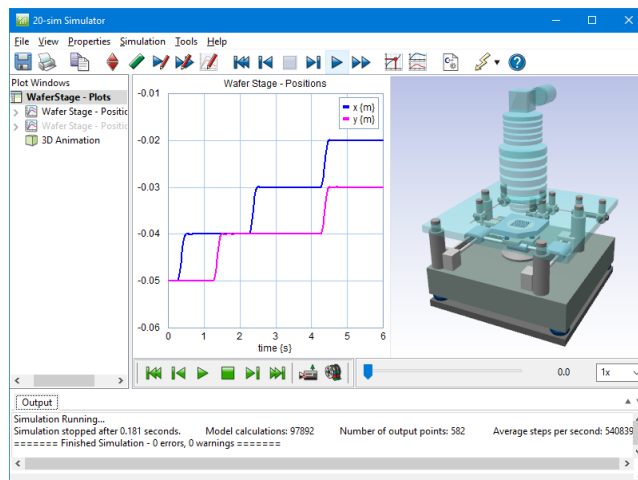

Show simulation results in plots and animations simultaneously.

Debug Mode and Fast Mode

20-sim can operate in two modes: *Debug Mode* 🐞▾ and fast Mode 🖉▾ This is indicated by the *Mode* button in the toolbar. In Fast mode a built-in runtime compiler is used which compiles the simulation model into platform specific 32-bit machine code. The result is a dramatic increase of simulation speed. 20-sim machine code runs faster than the equivalent compiled C-code! Compiling the machine code, even with large models, is done while you start up the *Simulator*. The compiler is an internal part of the 20-sim software. No external compiler or program is required!

Simulation Algorithms

20-sim contains powerful simulation algorithms for solving ordinary differential equations (ODE) and differential algebraic equations (DAE). It has a variety of numerical integration methods: one-step, multi-step and multi-order.

Discrete-time models

20-sim will automatically detect discrete-time loops in a model and assign each independent loop a separate sample rate. Discrete signals are shown in the Editor in green. Discrete-time parts are activated by time events so that mixed continuous-time and discrete-time models are handled correctly.

Events

20-sim can also handle state events based on zero-crossing algorithms. This results in a fast and accurate event detection and localization.

4.10 Toolboxes

20-sim contains a number of Toolboxes. The following toolboxes can be found in the Editor:

1. Control toolbox: This toolbox consists of the Controller Design Editor, the MLP Network Editor, the B-Spline Editor and the Filter Editor.

2. Mechatronics Toolbox: This toolbox consists of the Cam Wizard, the Motion Profile Wizard and the Servo Motor Wizard.

3. 3D Mechanics Toolbox: This toolbox consists of the 3D Mechanics Editor.

4. Frequency Domain Toolbox: This toolbox allows you to look at model properties in the frequency domain.

5. Scenario Manager: With this tool you can automate tasks like testing models.

The following toolboxes can be found in the Simulator:

6. Time Domain Toolbox: This toolbox contains powerful tools to inspect the behaviour of your model using time domain simulation: Parameter sweeps, Optimization, Curve Fitting, Tolerance analysis, Sensitivity analysis, Monte Carlo analysis and Variation analysis. You can also use External DLL's to run your time domain simulations.

7. Frequency Domain Toolbox: This toolbox allows you to look at model properties in the frequency domain.

8. Real Time Toolbox: This toolbox allows you to create C-code out of any 20-sim model for the use in real-time applications.

9. Animation Toolbox: This toolbox consists of the 3D Animation and Graph Animation tools.

Two toolboxes run externally from 20-sim:

10. Scripting Toolbox: 20-sim scripting allows you to run tasks in 20-sim automatically using scripts running in Python or other scripting tools. With these scripts you can open models, run simulations, change parameters, store results and much more.

11. 20-sim - Unity Toolbox: This toolbox couples 20-sim with the Unity game engine. Unity allows you to make 3D animations with high quality rendering and display on screen and VR headsets. The Unity toolbox does not come standard with 20-sim, but has to be purchased separately.

5 Equation Models

5.1 Introduction

Equations are the foundation for all models in 20-sim. At the lowest level of a model you will always find equations. Equations can be entered in the 20-sim *Editor*.

1. **Open** 20-sim and select **File**, **New** and **Graphical Model**.

The right part of the *Editor* will now allow you to graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*. The *Graphical Editor* will change into an *Equation Editor* if we go to the deepest level of any model.

2. Go to the left of the *Editor* and click the **Library tab**

Now the *Library Browser* will appear.

2. Click on **Examples** and **System Dynamics**.

3. Drag the model **LorenzAttractor** to the white space at the right (*Graphical Editor*).
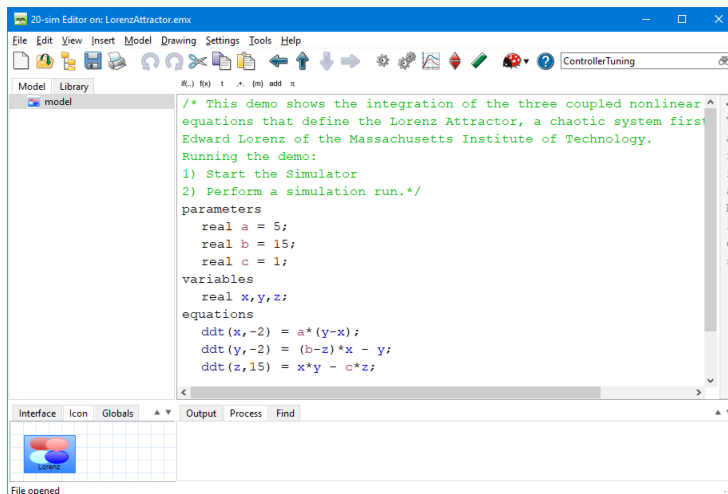

Equation model of the Lorenz Attractor.

As you will see the *Graphical Editor* changes into an *Equation Editor and* equation model is opened. This model is called an *equation mainmodel*, because it has no input signals, output signals or ports. This can be verified in the lower left part of the *Editor* which shows the *Interface* of the model (empty). A *mainmodel* is a model that cannot be connected with other models.

4. Open 20-sim and select **File**, **New** and **Graphical Model**.

5. Go to the left of the *Editor* and click the **Library tab**.

Now the *Library Browser* will appear.

6. Click on **Examples** and **Block Diagrams**.

7. Drag the model **Oscillator** to the white space at the right (*Graphical Editor*).

As you will see a block diagram model is opened. We will inspect the integrate element of this model.
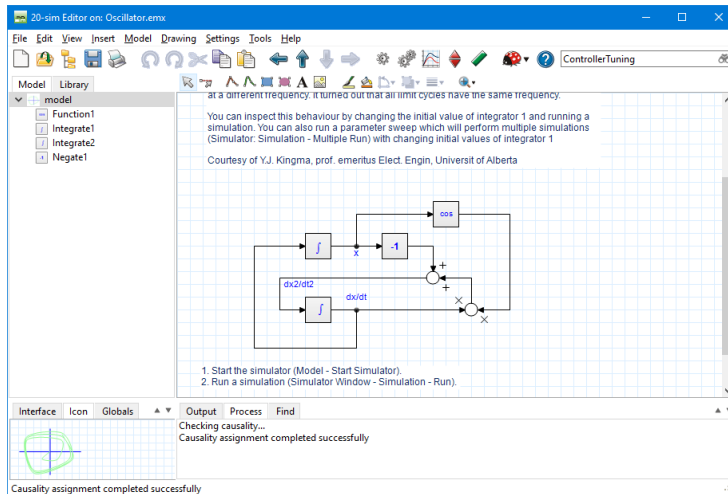

Block diagram model of an oscillator.

8. Go to the left of the *Editor* and click the **Model tab**.

Now the *Model Browser* will appear. The *Model Browser* shows the relevant block diagram elements of this model.

9. Select the **Integrate1** element.
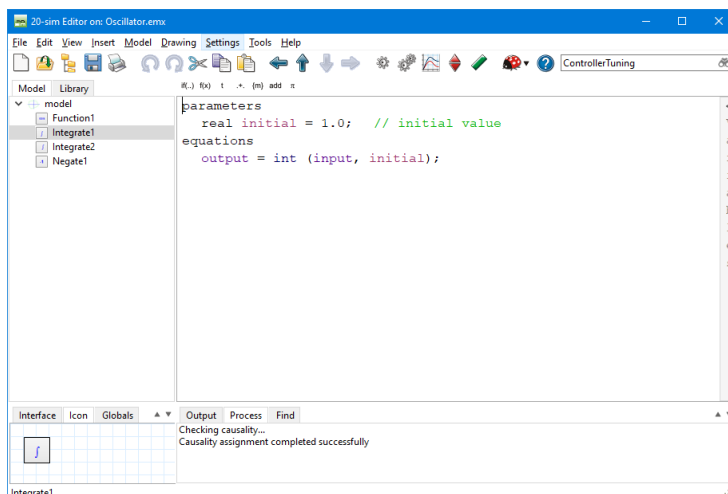

Equation implementation of an integration element.

As you can see an equation model is shown. This is called an *equation submodel*, because it has equations which relate an output signal to an input signal. The signals are defined in the lower left part of the *Editor* (the *Interface*). A *submodel* is in general a model that can be connected to other *submodels* using *signals* or *power ports*.

In the next sections we will show how to create equation mainmodels and submodels. We will start with a simple mechanical system and show how it can be described by differential equations. We will enter these equations in 20-sim in the form of an equation mainmodel. In next section we will show how to model a pendulum with differential equations incorporated in an equation submodel.

5.2 Equation Mainmodel

Differential Equations

We consider the mechanical system of the figure below.
A mass with spring and damper.

We will first derive the necessary equations for this system and then enter these equations in 20-sim and do a simulation. For the mass we can write the following equation:

$$F_m = m \cdot a = m \cdot \frac{dv}{dt}$$

where *Fm* is the force on the mass *m* due to its inertia, *v* the velocity and *a* the acceleration. In block diagram models integration is to be preferred above differentiation, so we rewrite the equation for *Fm*:

$$v = \frac{1}{m} \int F_m \, dt$$

For the spring we can write:

$$F_s = K \cdot x = K \int v \, dt$$

where *Fs* is the force on the spring and *K* is the spring constant. For the damper we can write:

$$F_d = f_v$$

where *Fd* is the force due to viscous friction and *f* is the friction parameter. For the gravity force we can write:

$$F_g = -m \cdot g$$

where *Fg* is the force due to gravity and *g* is the acceleration of gravity. Combining the forces leads to the following set of differential equations:

$$F_m = -m \cdot g - F_s - F_d$$

$$v = \frac{1}{m} \int F_m \, dt$$

$$F_s = K \cdot x = K \int v \, dt$$

$$F_d = f_v$$

Equation Model

These equations can be entered in 20-sim directly as equations. We will use an equation mainmodel. A *main* model means that the model has no input or output signals to connect it with the outside world.

1. Open 20-sim and select **File**, **New** and **Equation Model**.

Make sure that 20-sim is in **Debug Mode**. The right part of the *Editor* will now allow you to create graphical models. That is why we have named this part of the *Editor* the *Graphical Editor.* Equations in 20-sim written in a special language called SIDOPS+. This language is similar to mathematical equations and is easy to learn.
The taskbar of the Equation Editor.

Look at the *taskbar* at the top of the *Equation Editor*. The *taskbar* contains buttons to insert functions, statements and other language constructs of SIDOPS+.

2. From the *task bar* select the **add** button. Choose **Equation Examples** and **Simple**.

Now you will see a simple example of an equation model. Your *Editor* should look like:
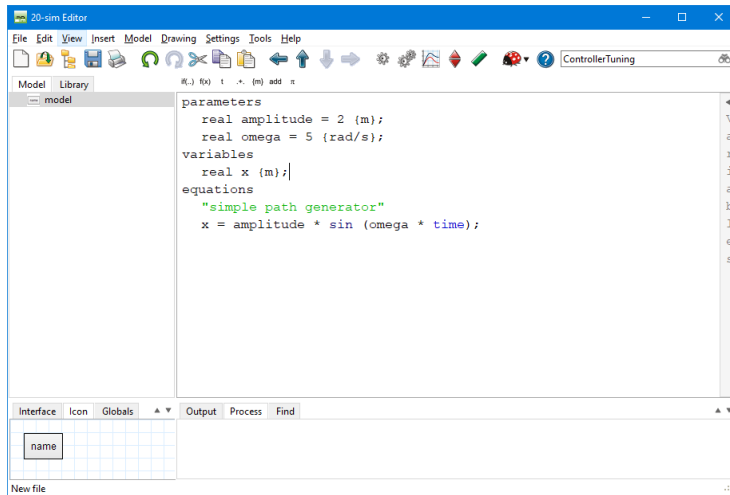

Using the add button you can insert the template of a simple set of equations.

An equation model starts with the declaration of *parameters* and *variables*, followed by the actual *equations*. You can easily get help by putting the mouse pointer on top and pressing the **F1** key.

3.   Put the mouse pointer on top of the word **sin**, click once with the left mouse button and press the **F1** key.

Now the 20-sim *Help file* should open with the topic on the *sine* function opened.

4.   **Close** the Help File.

We will enter the differential equations from the previous topic.

5.   **Clear** all **equations** from the Editor (select them and press delete).

6. **Enter** the following **equations** (you can copy and paste them):

    parameters
    *   real m = 1.0 {kg}; // mass*
    *   real g = 9.8 {m/s2}; // gravity*
    *   real K = 2.0 {N/m}; // spring constant*
    *   real f = 1.0 {N.s/m}; // friction parameter*
    variables
    *   real v {m/s}; // velocity*
    *   real interesting x {m}; // position*
    *   real Fm {N}; // net-force applied to the mass*
    *   real Fs {N}; // spring force*
    *   real Fd {N}; // damper force*
    equations
    *   Fm = -m * g - Fs - Fd;*
    *   v = (1/m) * int(Fm , 0);*
    *   x = int(v , 0);*
    *   Fs = K * x;*
    *   Fd = f * v;*

7. **Delete empty lines** and use the tab-key to get a better layout.

Your Editor should now look like:
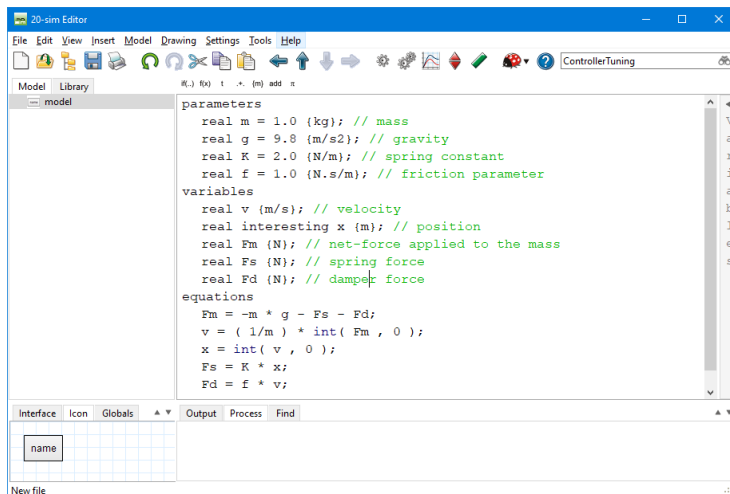

The equations of the spring-damper-mass model entered.

8. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings:
The results of model compilation are shown in the Process tab.

If any errors are found, a message window pops up, showing the errors which 20-sim has found. The figure below shows the errors that are generated when a multiplication is missing (*m g* should be *m*g*). You can click on the error in the *Process tab* to highlight the corresponding equation.
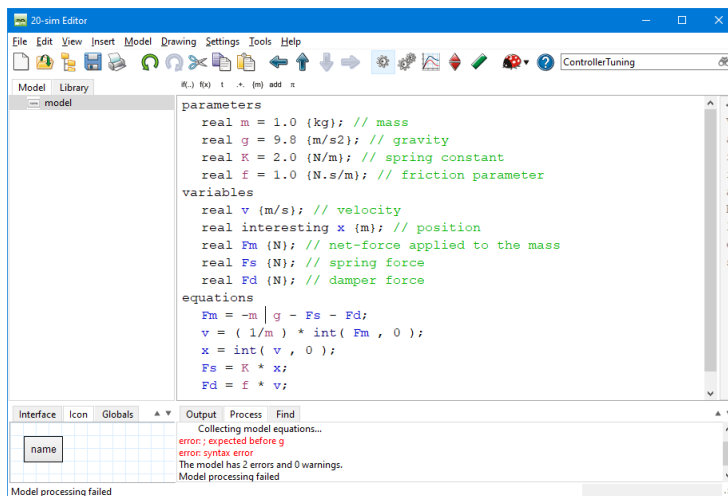

If errors occur, messages will be generated in the Process tab.

9.   If any errors occur, try to solve them.

10. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *EquationModel.emx*.

If you have problems entering the equations or checking the model, load the model *Equation Mainmodel* from the *Getting Started\Equation Models* section of the library.

Simulation

Now we have entered the equation model, we will proceed and show how you can run a simulation.

11. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the Simulator window. We will proceed with this window.
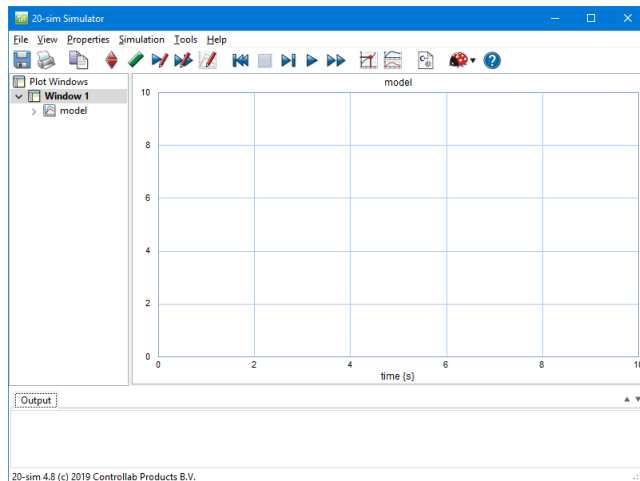

The Simulator will open with an empty plot.

12. In the *Simulator* toolbar from **the Properties** menu select the **Parameters** command.

The *Parameters Editor* shows all the parameters of your model. It is a useful tool to quickly change the value of a parameter. Check that the parameter values of your model are equal to the values in the picture below.
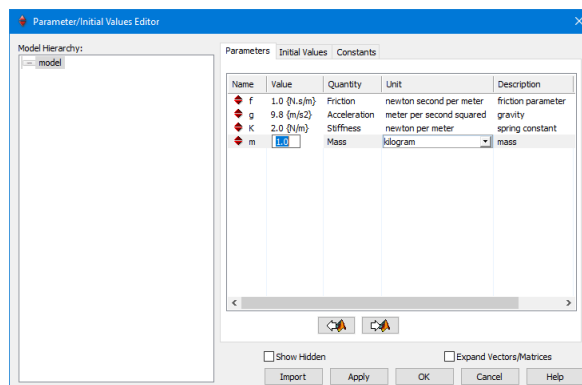

The Parameters Editor allows you to make quick changes to the parameters in a model.

13. From the **Properties** menu select the **Run** command.

14. The *Run Properties Editor* shows the simulation settings. Change the **Finish Time** to 15 s and the Integration Method to **Euler**.
The Run Properties Editor allows you change the simulation settings.

15. Specific settings for the Euler method can be selected by clicking the **Set Properties** button. Set the **step size** equal to 0.2 s.
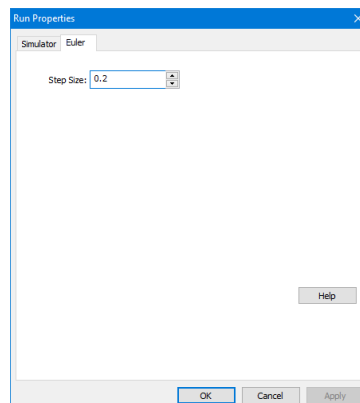

The second tab shows the specific settings of the chosen Integration Method.

16. From the **Properties** menu select the **Plot** command.
In the Plot Properties Editor you can define the settings of a plot.

17. In the **Y-axis** tab click **Choose**.

This opens the *Variable Chooser* which helps you to select the variable that should be plotted. It should look like:
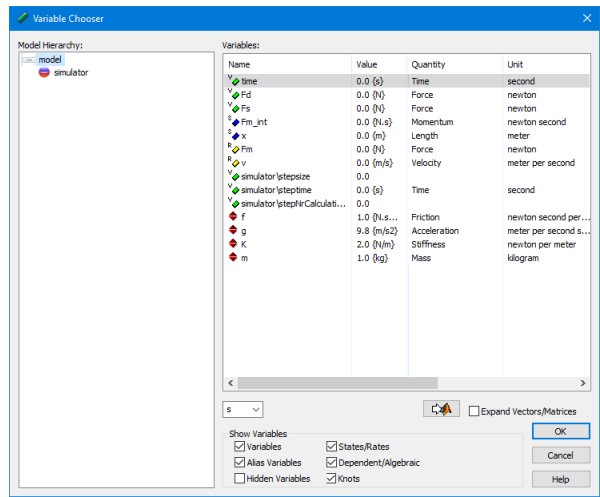

The Variable Chooser shows the model variables and their current values.

18. Select the variable *x* and click **OK**.

19. Select the **Plot Properties** tab and change the **Title** to *Equation Mainmodel*.
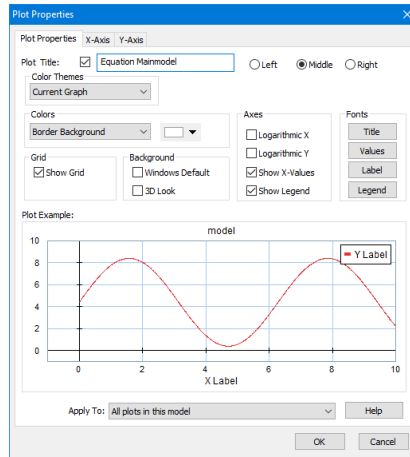

You can give a plot any desired look and feel.

20. Click **OK** to close the Plot Properties Editor.

21. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
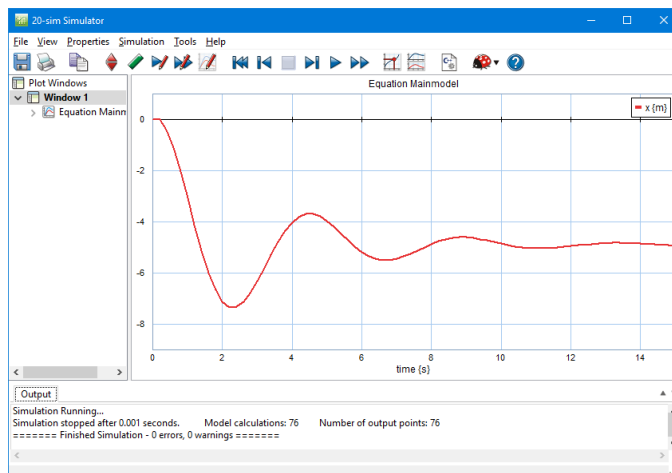

The simulation results of our equation mainmodel.

22. From the **File** menu click **Save**.

If you had problems running a simulation, load the model *Equation Mainmodel* from the *Getting Started\Equation Models* section of the library.

23. Now go back to the **Editor**.

24. Click on the small **triangle** of the **Variables pane** at the right of the Editor or drag the pane to the left:
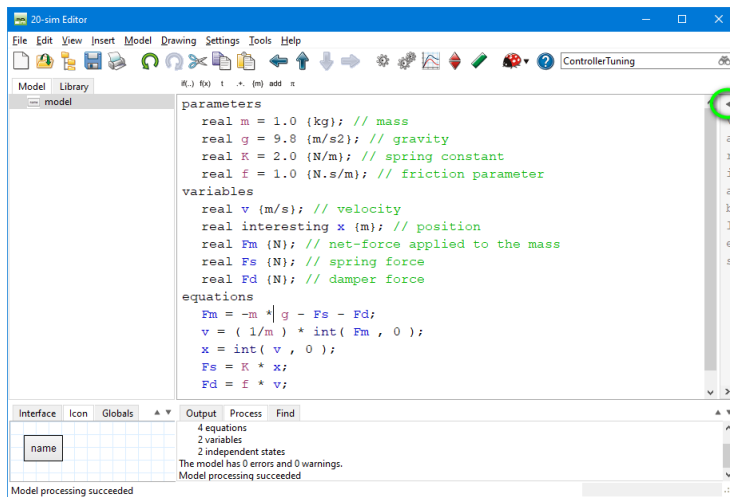

This will show the Variables pane showing you all the parameter and variable values.
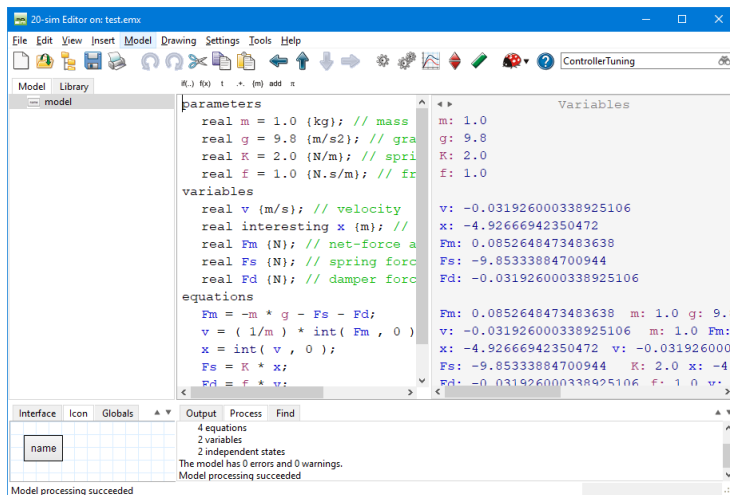

5.3   Equation Submodel

Differential Equations

In the second part of this lesson you will learn how to enter the equations of motion of a simple pendulum in an equation submodel. If we transfer all equations to the hingepoint with angle theta, the equations of motion of a simple pendulum can be described as:

m·l²·s²·theta = T - c·s·theta - m·g·l·sin(theta)

or

s²·theta = (T - c·s·theta)/(m·l²) - g/l·sin(theta)

with:

theta   pendulum angle (rad)
T   applied torque on the pendulum (Nm)
l   pendulum length (4 m)
m   pendulum mass (0.25 kg)
c   friction at the pendulum hinge (0.1 Nms/rad)
g   gravity constant (9.8 m/s²)
Written as first order differential equations:

    theta_dot_dot = (torque - c·theta_dot)/(m*l2) - (g/l)·sin(theta);
    theta_dot = int(theta_dot_dot);
    theta = int(theta_dot);

The input variable is the applied torque and the output variable is the pendulum angle theta. This equation submodel will be used in a block diagram model as shown below. A square wave generator will act as torque and the signal monitor block will catch the output angle theta.
A pendulum submodel implemented by equations.

Entering Equations

These equations can be entered in 20-sim directly as equations. We will use an equation submodel. A *submodel* means that the model has input or output signals to connect it with the outside world.

1.   Open 20-sim.

Make sure that 20-sim is in **Debug Mode**.

2. Select **File**, **New** and **Graphical Model**.

The right part of the *Editor* will now allow you to graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*. The *Graphical Editor* will change into an *Equation Editor* if we go to the deepest level of any model.

3. Go to the left of the *Editor* and click the **Library tab**.

4. Drag the following library models to the *Graphical Editor*:

model library	model
Library\Signal\Sources	*WaveGenerator-Square*
Library\Signal\Block Diagram	*SignalMonitor*

5. Select the *SignalMonitor* submodel.

6. From the **right mouse menu** or from the **Model** menu select the **Properties** command.

7. Change the **name** of the model to *Angle* and click **OK**.

8. **Rename** the other submodel to *Torque*.

The *Editor* now should look like:
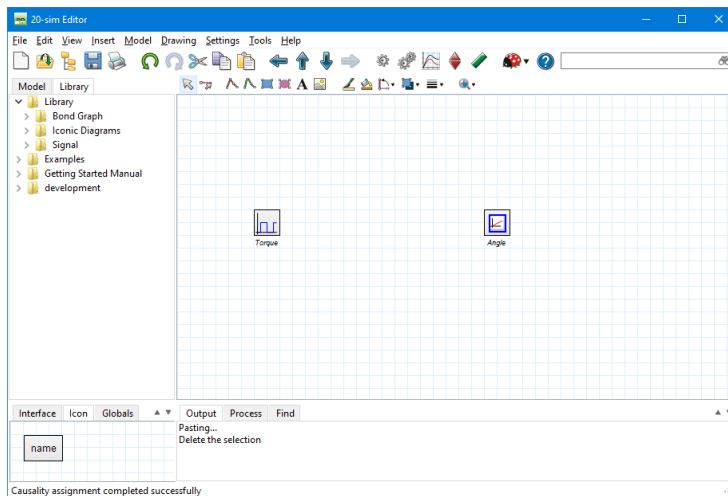

Drag and drop models from the library to the Graphical Editor.

If the submodel names are not shown, select a submodel and from the **right mouse menu** choose **Show Name** and **Bottom**.

9. Put the mouse pointer in between the two submodels. From the right mouse menu or from the **Insert** menu select **Empty Submodel**.

This adds an empty submodel.

10. **Rename** the new Submodel to *PendulumSubmodel (right mouse menu - Properties)*. Use the **right mouse menu** to **show the name** at the **bottom**.

The *Editor* now should look like:
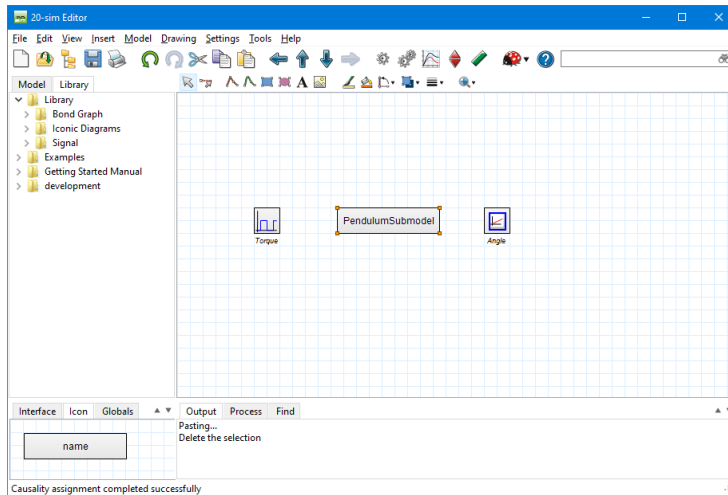

Drag and drop models from the library to the Graphical Editor.

11. Make sure that the *PendulumSubmodel* is **selected**.

12. From the **right mouse** select **Edit Interface**.

This will open the *Interface Editor*.
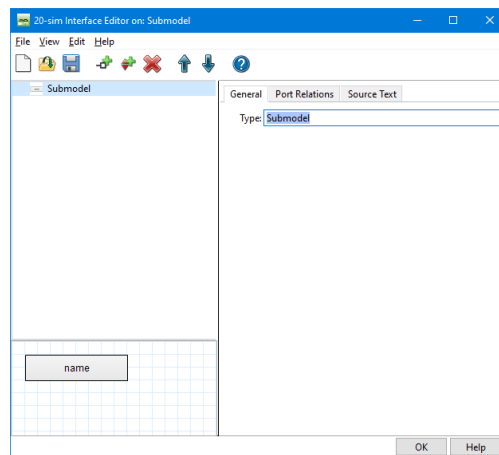

The Interface Editor is used to define input and output signals.

In the *Interface Editor*, you can define the model interface. We are going to define two signals: one input signal (*Torque*) and one output signal (*Angle*).

13. Change the **Name** to *PendulumSubmodel*.

14. From the **Edit** menu select **Add Port**.

15. Choose the following settings:

Items	Values
Name	torque
Type	Signal
Orientation	Input
Quantity	torque

Your *Interface Editor* should now look like:
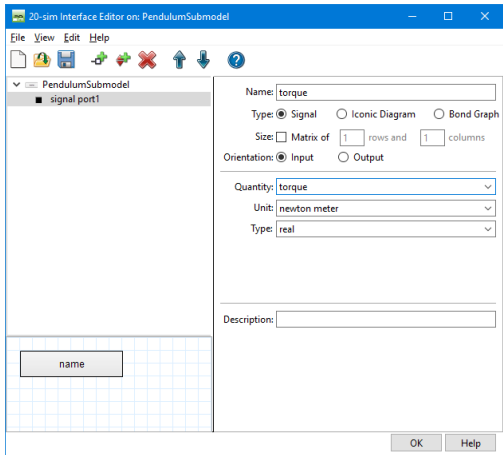

The input signal represents a torque.

16. From the **Edit** menu select **Add Port**.

17. Now choose the following options:

Items	Values
Name	theta
Type	Signal
Orientation	Output
Quantity	angle

Your *Interface Editor* should now look like:
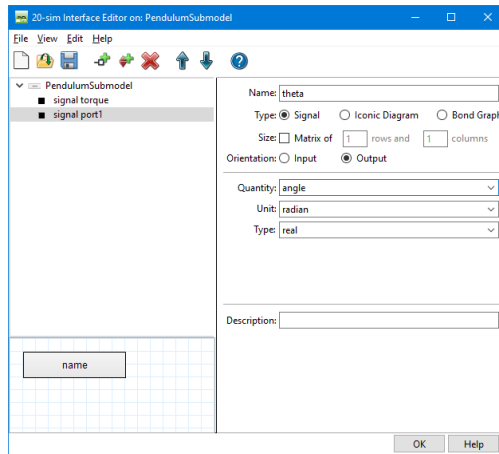

The output signal represents an angle.

18. Close the *Interface Editor* by clicking the **OK** button.

Now we have defined the *Interface* of our equations submodel. Next we will change its appearance.

13. Make sure that the *PendulumSubmodel* is **selected**.

14. From the **right mouse** select **Edit Icon**.

Now the *Icon Editor* will be opened:
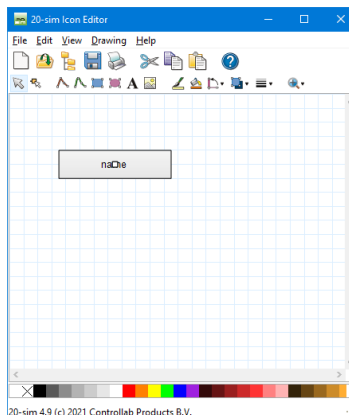

The Icon Editor is used to create custom made model icons.

In the *Icon Editor,* you can change the icon of the model. As you can see, a default icon has been generated. The terminals (dots in the center, indicating where the signals connections should be) are already available. We are only going to enlarge the gray square.

21. In the toolbar of the Icon Editor, click the **left arrow** ⬉ to change to *selection mode*.

22. **Select** the gray box.

Four orange squares, indicating the corners of the box, will now be visible.

23. While the square is still selected, go to the colorbar at the bottom of the *Icon Editor*.

24. Point the mouse on the color yellow and click the **right mouse button**.

Now the square should have a yellow background and a black border (with the **left mouse button** the border color can be selected).

25. Select the text (name) in the middle of the square.

26. From the **right mouse menu**, click **Properties**.

A text editor pops up.

27. Change the default text to *Pendulum Submodel* and click **OK**.

28. Select the square and **drag the corners** until it is large enough to contain the text.

29. Select the text **Pendulum Submodel**.

30. Click the keyboard arrows to move the text to the center of the square (press the **Shift** button while dragging for fine movements).

31. Click on the small squares in the middle, representing the input signal (torque) and the output signal (theta) and **drag** them to the **borders** of the square.

Now the icon should look like:
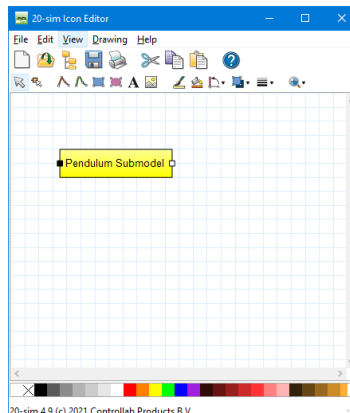

The black squares indicate the connections for the input and output signal.

32. From the **File** menu select **Exit**. A pop-up window will ask you to *update* the graph first. Choose **Yes**.

You *Editor* will now show the yellow icon. So far we have given the model an icon and an interface. Now we are going to enter its implementation in the form of equations. Look at the *taskbar* at the top of the *Graphical Editor*. The *taskbar* contains buttons create connections, draw lines and more.
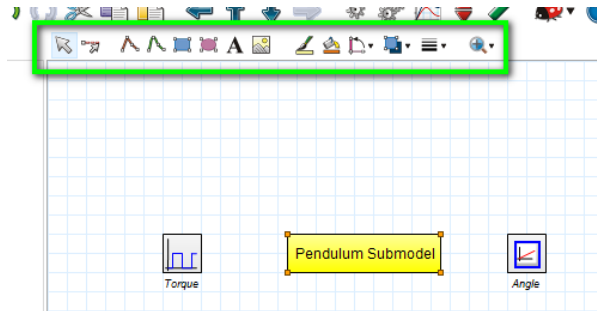

The taskbar of the Equation Editor with the selection mode selected.

33. In the **taskbar**, choose the **left button** . This is the *Selection mode* button.

34. **Select** the *PendulumSubmodel*.

35. From the **Model** menu select the **Go Down** command.

The submodel has no implementation. A window will therefore pop-up, asking you what kind of implementation you would like.

36. Select **equation submodel**.

Now an empty *Equation Editor* will be shown:
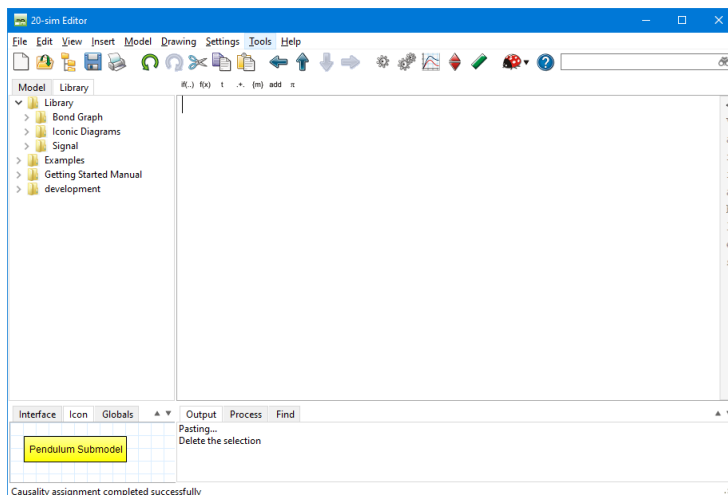

The submodel has an empty implementation.

We will enter the differential equations that where at the start of the topic.

37. **Copy** the following equations to the **Equation Editor**.

    parameters
        real l = 4.0 {m};
        real c = 0.1 {N.m.s/rad};
        real g = 9.8 {m/s2};
        real m = 0.25 {kg};
    variables
        real theta_dot_dot {rad/s2};
        real theta_dot {rad/s};
    equations
        theta_dot_dot = (torque - c * theta_dot)/(m*l^2) - (g / l) * sin(theta);
        theta_dot = int (theta_dot_dot , 0);
        theta = int (theta_dot , 0);

You model should now look like:
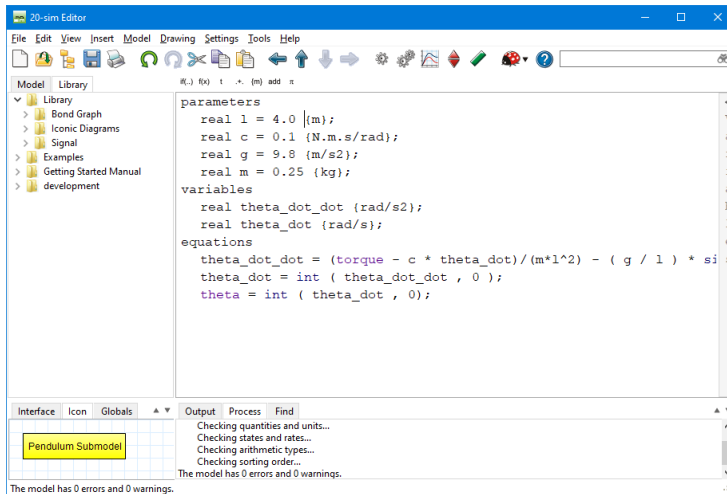

The submodel is implemented by equations.

38. From the **Model** menu select the **Check Submodel** command. Now the submodel will be checked. If any errors are found, a message window pops up.

39. Return to the main model level of the hierarchy: From the **Model** menu select the **Go Up** command.

Now we have completed our equation submodel. The only thing that is left is to connect it to the other models.

40. In the **taskbar**, choose the **second left button** 🖼. This is the *Connection mode* button.

41. **Select** the submodel *Torque* and then the submodel *PendulumSubmodel*.

Now a signal should be visible pointing from *Torque* to *PendulumSubmodel*.

42. **Connect** the submodels *PendulumSubmodel* and *Angle*.

Now your model should look like:
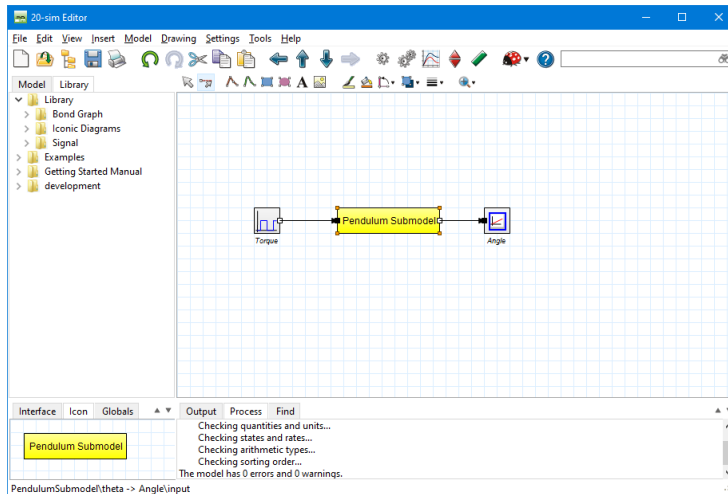

The equation submodel connected to the other models.

43. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings:
The results of a model check are shown in the Output tab.

If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation.

44. If any errors occur, try to solve them.

45. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *EquationSubmodel.emx*.

If you had problems running a simulation, load the model *Equation Submodel* from the *Getting Started\Equation Models* section of the library.

Simulation

We have entered the model and proceed with the simulation.

46. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the *Simulator* window. We will proceed with this window.

47. In the *Simulator* toolbar from **the Properties** menu select the **Parameters** command and change the default parameter values to:

Torque\Amplitude	*4*
Torque\omega	*0.1*
PendulumSubmodel\l	*4*
PendulumSubmodel\c	*0.1*
PendulumSubmodel\g	*9.8*
PendulumSubmodel\m	*0.25*

Note that 20-sim will sometimes use prefixes like *m* (= 0.001), when working with units. The value of *PendulumSubmodel\c* may therefore be indicated as 100 m N.m.s./rad.

48. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	100
Method	Runge-Kutta 4
Step Size	0.1

49. From the **Properties** menu select the **Plot** command.

50. Select the **Plot Properties** tab and change the **Plot Title** to *Equation Submodel*.

51. Select the **Y-axis** tab.

The variable Angle\plot is automatically selected.

52. Change the label to *Angle*.

53. Click the **Add Curve** button.

This opens the *Variable Chooser* which helps you to select another variable that should be plotted.

54. Select the variable **Torque\output** from the list and click the **OK** button.

55. Change the label to *Torque*.

56. **De-select** the *Shared Y-Axes* option.

57. Close the *Plot Properties Editor* by clicking the **OK** button.

58. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
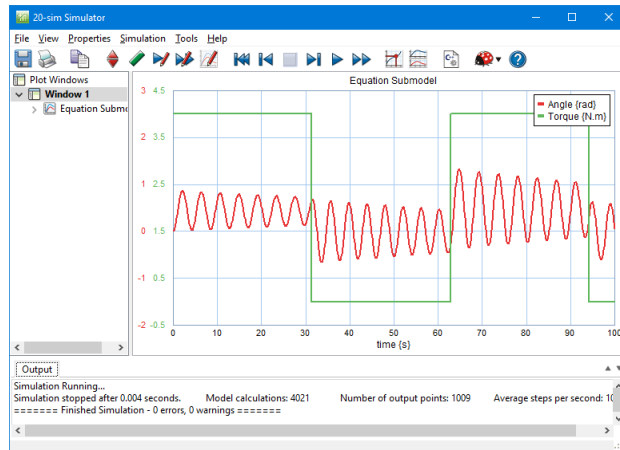

The simulation results of the equation submodel.

59. From the **File** menu click **Save**.

60. In the **Simulator**, click on the Distribute Curves button (see below).
With this button, you can separate the curves each into one plot with a shared x-axis. If you click on the *Distribute Curves* button again, you will see the two curves in a single plot with a shared y-axis. If you click on the *Distribute Curves* button again, you will see the original plot.

If you had problems running a simulation, load the model *Equation Submodel* from the *GettingStarted\Equation Models* section of the library.

6   Block Diagrams

6.1   Block Diagram Mainmodel

Differential Equations

We consider the mechanical system that was also use for the equation main model. In this lesson on you will learn how to describe this system with a block diagram.
A mass with spring and damper.

The mechanical system can be described by the following set of differential equations:

$$F_m = -m \cdot g - F_s - F_d$$

$$v = \frac{1}{m} \int F_m \, dt$$

$$F_s = K \cdot x = K \int v \, dt$$

$$F_d = f_v$$

Block Diagram Model

Drag and Drop

These equations can be entered in 20-sim using a block diagram. We want to obtain the following block diagram.
Block Diagram model of the mechanical system.

1. Open 20-sim and select **File**, **New** and **Graphical Model** and make sure that 20-sim is in **Debug Mode** .

The right part of the *Editor* will now allow you to enter graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*.

2.   Go to the left of the *Editor* and click the **Library tab**.

3.   Drag the following library models to the *Graphical Editor*:

model library	**model**
Library\Signal\Sources	*Constant*
Library\Signal\Block Diagram	*Attenuate*
Library\Signal\Block Diagram	*Integrate (2×)*
Library\Signal\Block Diagram	*Gain (2×)*

4.   Select the *Constant* model. From the **Model** menu select the **Properties** command. This will open the *Model Properties Editor*.

5.   **Rename** the model to *Fg*.

6.   Do so with all the models until your *Editor* looks like:
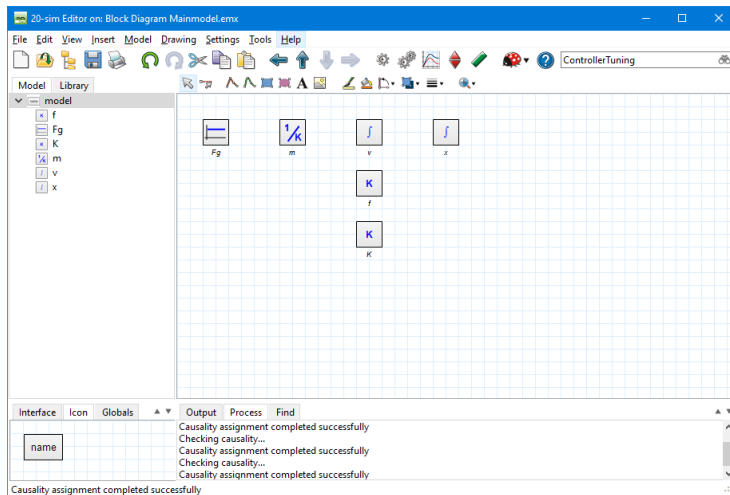

You can give block diagram elements useful names.

Connections

7.   In the **taskbar**, choose the **second left button** (the mouse pointer with line). This is the *connection mode* button .

8.   Select the model ***Fg*** (left mouse click on top of the *Fg* model) and then the model ***m*** (left mouse click on top of the *m* model).

Now a signal should be visible pointing from Fg to m.

9. Enter the other connections until your *Editor* looks like the figure below. You can make intermediate points (the corners of a connection) by quickly clicking the left or right mouse button, while dragging.

If you have problems making connections please note that there are two way to make a connection: **tapping** mode and **pressing** mode. With the **tapping** mode you click the left mouse button at the first model (do not keep it pressed but quickly "tap" the button) and keep tapping until the second model is reached. With the **pressing** mode you press left mouse button on the first model and keep it pressed until the second model is reached. Intermediate points in pressing mode are made by clicking the right mouse button.
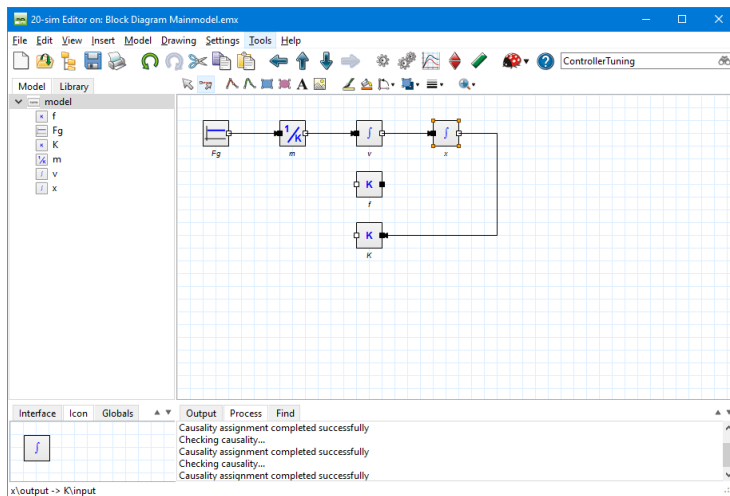

Using the connection model button, you can create connections between elements.

If you want to change there position of the models or connections, you have to switch to the *selection mode* button. You can switch to selection mode by clicking **left button** (the mouse pointer) of the **taskbar**. Make sure to switch back to *connection mode* to make the other connections.

Splitters

10. Click on the **middle** of the signal pointing from the submodel *v* to *x*.

A splitter will be inserted.

11. Make a **connection** from the **splitter** to the model *f*.

Your model should look like:
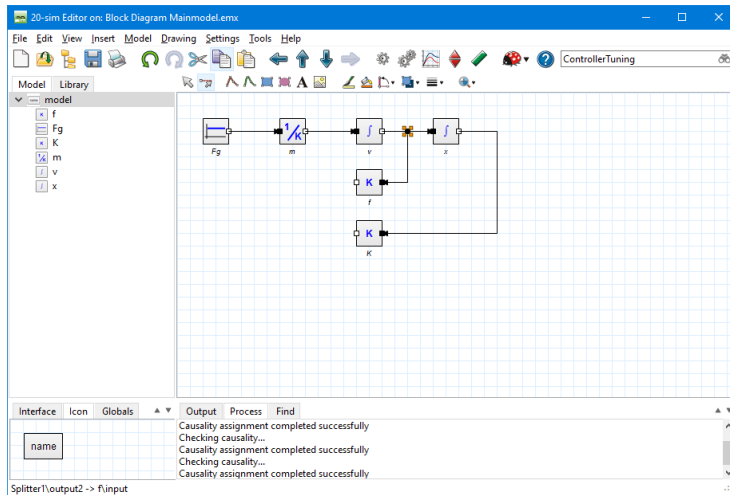

Click on a signal to insert splitters.

Plus Minus

12. Click on the *K* model to start a connection and then click on the **middle** of the signal pointing from the submodel *Fg* to *m.*

13. 20-sim will open a dialog asking you to insert a multiplication or addition. Select the **PlusMinus** option and select the **minus** sign.

14. **Repeat** this action by making a connection from the *f* model to make your *Editor* look like:
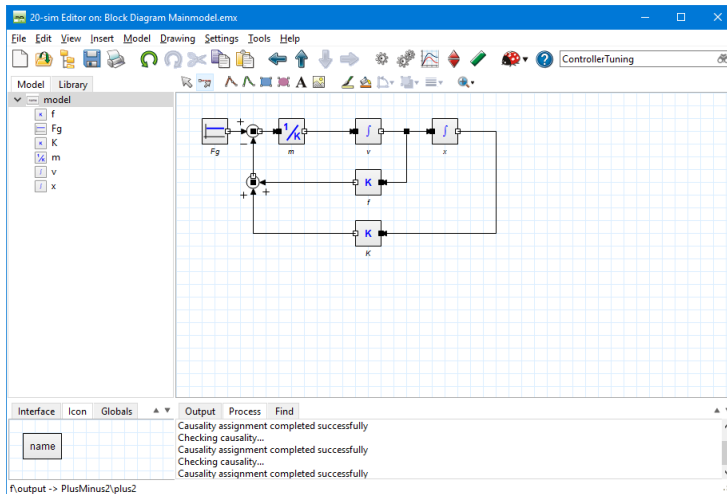

if you end a connection on another connection 20-sim will insert a multiplication or addition.

Compiling

15. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings. If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation.

16. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *Block Diagram Mainmodel.emx*.

If you have problems creating the model, load the model *Block Diagram Mainmodel* from the *Getting Started\Block Diagrams* section of the library.

Simulation

17. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the *Simulator* window. We will proceed with this window.

18. In the *Simulator* toolbar from **the Properties** menu select the **Parameters** command and change the default parameter values to:

Fg\C	-9.8
m\K	1
f\K	1
K\K	2

19. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	15
Method	Euler
Step Size	0.2

20. From the **Properties** menu select the **Plot** command.

21. Select the **Plot Properties** tab and change the **Plot Title** to *Block Diagram Mainmodel*.

22. Select the **Y-axis** tab and click **Choose** to open the Variable Chooser.

22. Select the variable *x\output* from the list and click **OK**.

23. Set the following values:

Tick Style Properties

Tick Style	Diamond Closed
Min. Distance (pixels)	2
Color	Red

Scaling

Scaling	Manual
From	-10
To	10

25. Close the *Plot Properties Editor* by clicking the **OK** button.

26. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
The simulation result.

27. From the **File** menu click **Save**.

If you had problems running a simulation, load the model *Block Diagram Mainmodel* from the *Getting Started\Block Diagrams* section of the library.

6.2   Block Diagram Submodel

Pendulum

In the topic Equation Submodel, we have found that a pendulum can be described by the differential equations:

theta_dot_dot = (torque - c·theta_dot)/(m*l2) - (g/l)·sin(theta);

theta_dot = int(theta_dot_dot);

theta = int(theta_dot);

We can also describe these equations with a block diagram. The input variable is the applied torque and the output variable is the pendulum angle theta. The corresponding block diagram is shown below:
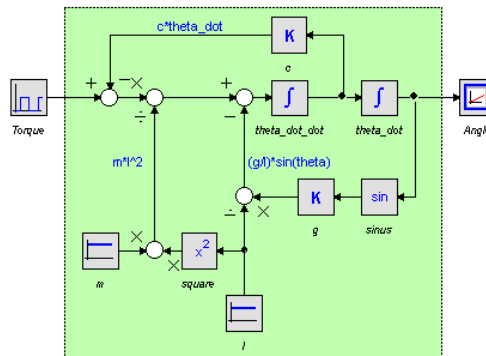

Block diagram model of a pendulum.

In the block diagram a square wave generator acts as torque and the signal monitor block catches the output angle theta. Block diagrams tend to grow complex easily when more elements are involved. To keep a good overview, hierarchy must be used. In this model the elements of the pendulum part (inside the green square) will be hidden in a submodel as shown below. Still the square wave generator will act as torque and the signal monitor block will catch the output angle theta.
Pendulum as a block diagram submodel.

1. **Open** 20-sim.

2. Make sure that 20-sim is in **Debug Mode**.

3. Try to create the block diagram at the top of this topic yourself or load the model *Block Diagram* from the *Getting Started\Block Diagrams* section of the library.

To make a submodel out of all the elements in the green square we first have to select all these elements. A multiple selection (i.e. more than one element selected) is easy in 20-sim. Two methods can be used:

- Keep the Shift key pressed while you click your mouse pointer on various elements.

- Press your left mouse button and keep it pressed while you drag the mouse pointer diagonal down (you are creating a square). As you move the mouse, you will see a square and every element in the square will be selected. Now you can release the left mouse button.

4. In the *Editor* **select all elements** that are in the **green square**.

Your Editor should now look like (only the models Torque and Angle not selected):
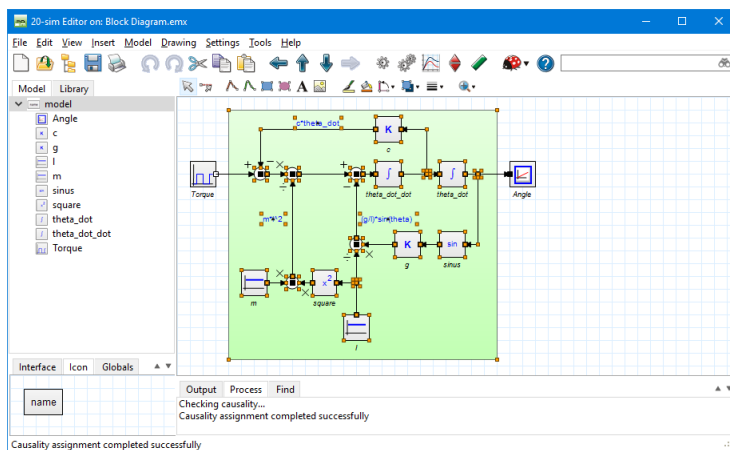

Drag a rectangle over an area to select multiple element.

5. From the **Edit** menu select **Implode**.

This will make all selected elements, part of a new submodel. Your model should now look like:
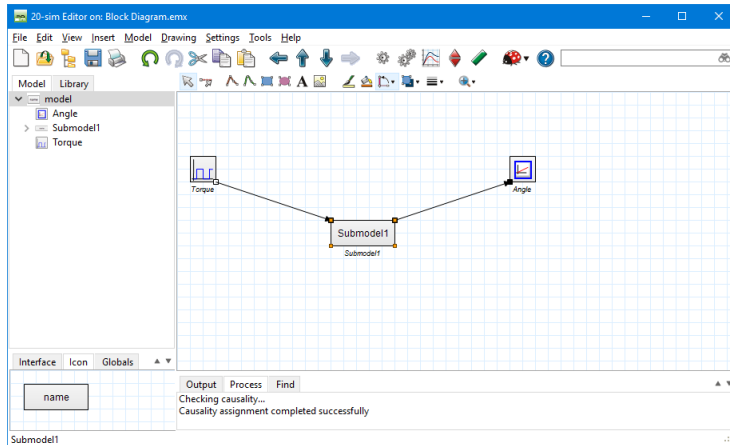

Use the Implode command to combine the selected elements into one submodel.

6. Select the new submodel and click **Go Down** (**Model** menu).

This command will show us the inside of the submodel. It should look like:
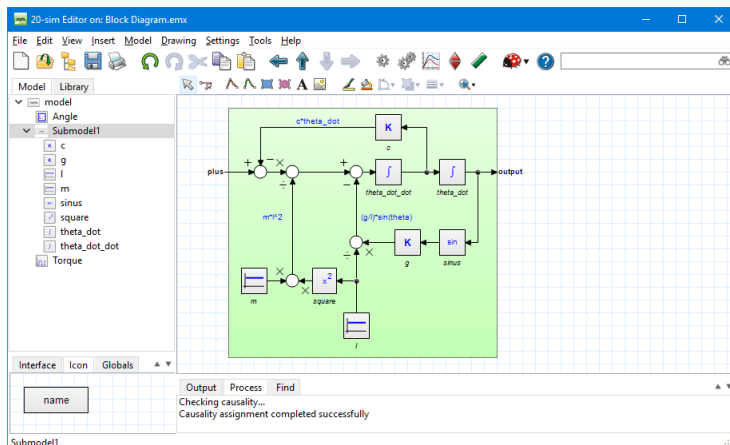

The implementation of the submodel is a block diagram.

As you can see, 20-sim has added ports (*plus* and *output*) automatically that connect the submodel to the outside world.

7. Click **Go Up** (**Model** menu) to go to the highest model level.

8. Select the new Submodel and change its name to *PendulumSubmodel* (select **Properties** from the **right mouse menu**).

9. **Select** the new Submodel and open the **Icon Editor** (select **Edit Icon** from the **right mouse menu**).

In the previous topic is explained how you can use the Icon Editor to change the appearance of a submodel.

10. Change the icon until it looks like:
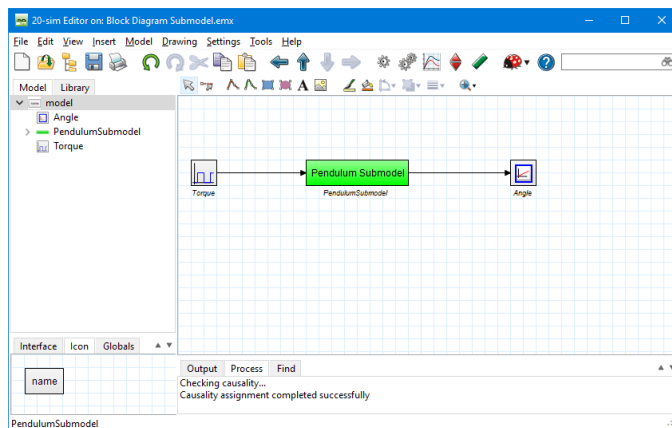

With the Icon Editor you can create custom made model icons.

11. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings. If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation.

12. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *Block Diagram Submodel.emx*.

If you had problems running a simulation, load the model *Block Diagram Submodel* from the *Getting Started\Block Diagrams* section of the library.

Simulation

We have entered the model and proceed with the simulation.

13. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the *Simulator* window. We will proceed with this window.

14. In the *Simulator* toolbar from **the Properties** menu select the **Parameters** command and change the default parameter values to:

PendulumSubmodel\c\K	0.1
PendulumSubmodel\g\K	9.8
PendulumSubmodel\l\C	4
PendulumSubmodel\m\C	0.25
Torque\amplitude	4
Torque\omega	0.1

15. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	100
Method	Runge-Kutta 4
Step Size	0.1

16. At the left of the Simulator, in the tree select plot under **Windows1** and change its name to **First Plot** (right mouse menu - Rename).

Now your *Simulator* should look like:
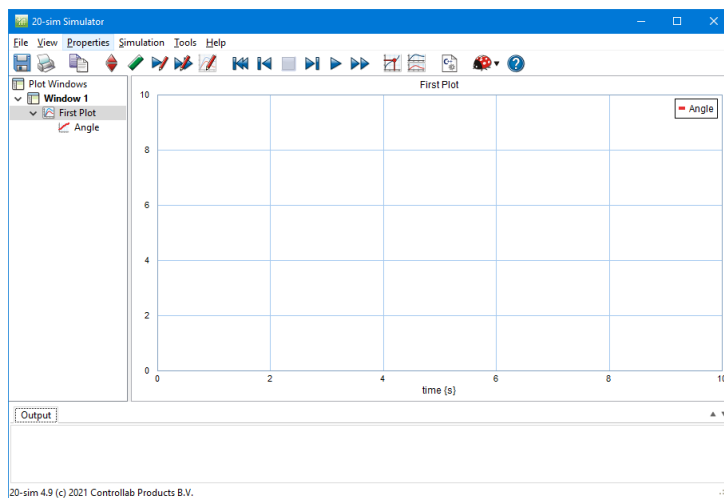

The Simulator with one plot and one curve entered.

17. In the tree at the left click on *Window 1* to select it.

18. From the right mouse menu select **Add Plot** - **Plot** and change its name to **Second Plot** (right mouse menu - Rename).

Now a second plot will be visible.
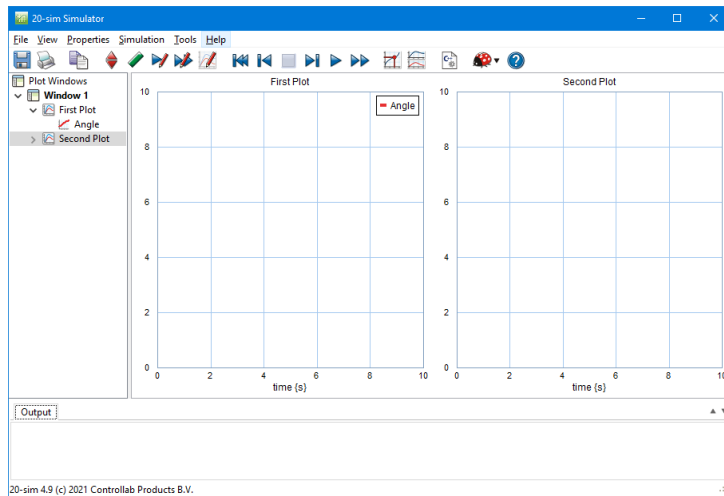

The Simulator with the second plot entered.

19. In the tree, select the second plot. From the **right mouse menu**, select **Plot Properties**.

20. Click on the **Choose** button to select the variable *Torque\output* and change the **Label** to *Torque*.

21. Give the plot a green color.

Now the Plot Properties should look like:
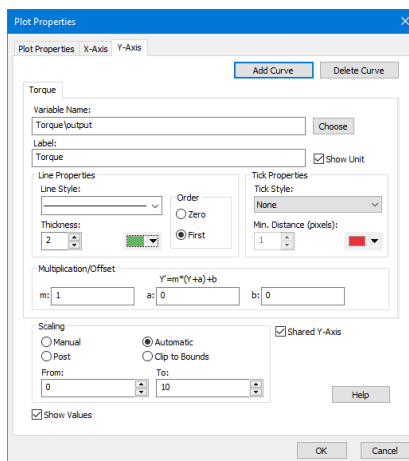

Entering a plot title and hiding it for display.

22. **Close** the Plot Properties by clicking **OK**.

23. In the tree at the left click on **Window1** to select it.

24. From the right mouse menu select **Tile Plots** - **Tile Vertical**.

25. **Run** a simulation

Now the Simulator should look like:
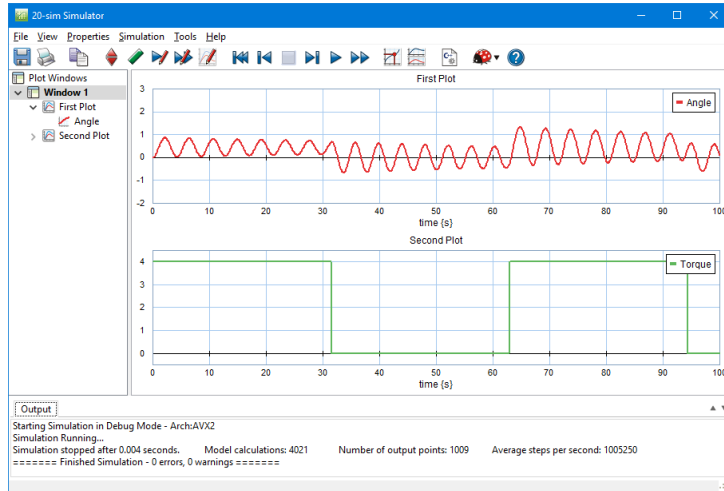

The simulation results of the block diagram submodel.

30. From the **File** menu click **Save**.

If you had problems running a simulation, load the model *Block Diagram Submodel* from the *Getting Started\Block Diagrams* section of the library.

7 Iconic Diagrams

7.1 Iconic Diagram (Electric)

In the previous lessons you have learned the basics of 20-sim and how to enter equation models and block diagram models. In this lesson you will learn how to enter iconic diagram models. In the first part an electric network will be entered and simulated. With help of this model, the importance of the **View** menu for iconic diagram models will be explained. After that a mechanical system will be entered and simulated.

1. Open 20-sim and select **File**, **New** and **Graphical Model** and make sure that 20-sim is in *Debug Mode* .

The right part of the *Editor* will now allow you to enter graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*.

2. Go to the left of the *Editor* and click the **Library tab**.

3. Drag the following library model to the *Graphical Editor*:

model library	model
Library\Iconic Diagrams\Electric\Sources	*VoltageSource (DC)*

The *VoltageSource* model has multiple implementations: *DC* and *AC*. When you drag and drop the model to the Graphical editor, you are asked which implementation should be used.

4. Choose the implementation **DC**.

You can always change the implementation by using the right mouse menu: select the model, right mouse menu, choose implementation.

5. Drag the following library model to the *Graphical Editor*:

model library	model
Library\Iconic Diagrams\Electric\Sources	*VoltageSource*
Library\Iconic Diagrams\Electric\Components	*Inductor*
Library\Iconic Diagrams\Electric\Components	*Resistor*
Library\Iconic Diagrams\Electric\Components	Capacitor
Library\Iconic Diagrams\Electric\Components	*Ground*

6. Select the *VoltageSource* model. From the **Settings** menu select the **Submodel** command.

This will open the *Model Properties Editor*.

7. **Rename** the model to *Voltage*.

8. Do so with all the models until your *Editor* looks like:
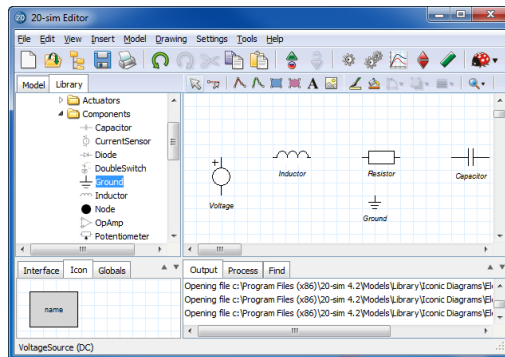

Drag and drop models from the library.

As in the figure above, leave a lot of space between the models. Otherwise some effects, explained later in this topic, might be hard to spot. Every iconic diagram model has one or more **terminals** to allow connections with other models.

9. To show these terminals, from the **View** menu click **Show Terminals**.

The terminals will be visible as open and closed rectangles:
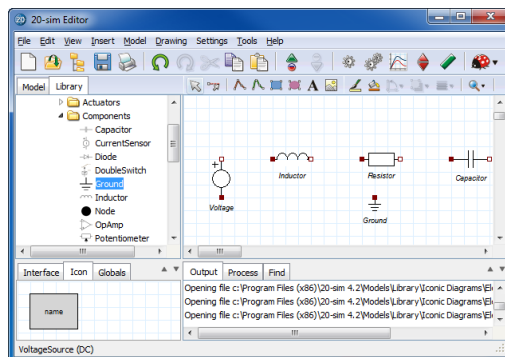

Use the View menu to show the terminals of the models.

10. In the **taskbar**, choose the **second left button** (the mouse pointer with line). This is the *connection mode* button.

11. Select the model *Voltage* and then the model *Inductor.*

Now a connection will be created between the two submodels.

12. Enter the other connections until your *Editor* looks like the figure below. You can make intermediate points (the corners of a connection) by clicking the right mouse button, while dragging.
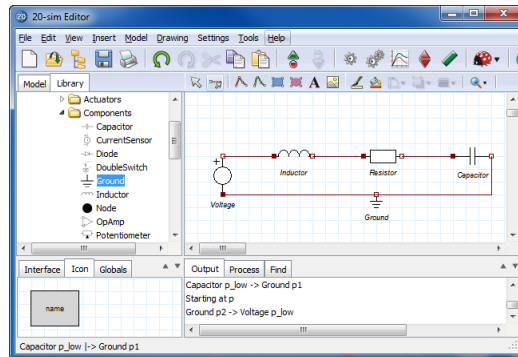

The complete model.

13. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings. If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation.

14. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *IconicDiagramModelElectric.emx*.

If you have problems creating the model, load the model *Iconic Diagram Electric* from the *Getting Started\Iconic Diagrams* section of the library.

Simulation

15. Select the **Start Simulator** command from the **Model** menu in the *Editor* window.

This opens the *Simulator* window. We will proceed with this window.

16. In the *Simulator* window, select from the **Properties** menu the **Parameters** command and change the default parameter values to:

Voltage\U	1V
CapacitorC	1u
Resistor\R	10
Inductor|L	1m

17. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	1e-3
Method	Backward Differentiation Formula (BDF)

18. From the **Properties** menu select the **Plot** command.

19. Select the **Plot Properties** tab and change title to **Iconic Diagram Electric**.

20. Select the **Y-axis** tab and select the variable *Capacitor\p.u* for plotting.

21. Change the **label** to **Capacitor Voltage.**

22. Close the *Plot Properties Editor* by clicking the **OK** button.

23. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
The simulation results for the electric circuit.

As you can see, creating a model and starting a simulation is easy in 20-sim. If you have problems creating the model, load the model *Iconic Diagram Electric* from the *Getting Started\Iconic Diagrams* section of the library.

7.2   View Menu

In this topic we will give some more insight into the model of the electric circuit.

1. If you had problems creating this model, **load** the model ***Iconic Diagram Electric*** from the *Getting Started\Iconic Diagrams* section of the library.

2. Go to the ***Editor***.

Across and Through

In iconic diagrams, connections describe the flow of energy from one model to another. This flow of energy can be characterized by two variables, of which the product is power. These variables are called **across** (**a**) and **through** (**t**). The **across** and **through** variables make up a combination that is typical for a physical domain. For electrical networks these variables are **voltage** and **current**. In 20-sim we can inspect the **across** and **through** variable of every connection.

3. Put your **mouse pointer** on top of a **connection**, until a little window pops up.

It should look like the figure below (don't worry when the values are different, these are just example values):
If you put your mouse pointer on top of a connection, the corresponding values are shown.

As you can see, the connection has a voltage (across) of 993 [mV] and a current (through) -39 [uA]. Across variables (voltages in this model) in the top level of a model, are always defined with respect to a single global reference of 0 V. This means that the voltage is defined with respect to the ground.

Through variables, like the current in this model, are always defined with respect to the models they are connected with. 20-sim automatically assigns an orientation for these through variables. This orientation can be made visible by selecting the *Orientation Info* command of the View Menu.

4. From the **View menu** enable the option **Show Terminals** (click it until the option is enabled).

5. From the **View menu** click the option **Orientation Info** (click it until the option is enabled).

Your model should look like:
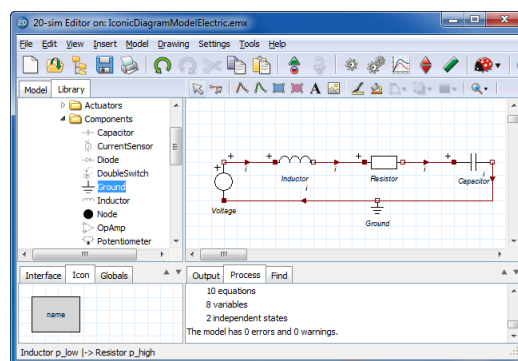

With the View menu you can show the orientation that 20-sim has chosen for positive currents.

The arrows indicate the direction of the **positive** currents. Now you will understand why open and closed rectangles are used to indicate the **terminals**. Open rectangles will have an outward oriented positive current and closed rectangles will have an inward oriented positive current. In the previous figure of this topic we saw a current value of i = -39 [uA]. With the given orientation this means a current i = 39 [uA] flowing from the resistor to the inductor.

Internal Description

6. From the **View** menu select **Port Names** Info.

7. Drag the *Inductor* model to the bottom, to have a better view of the port names.

Your model should have all ports (input signals, output signals or power ports) indicated by their name:
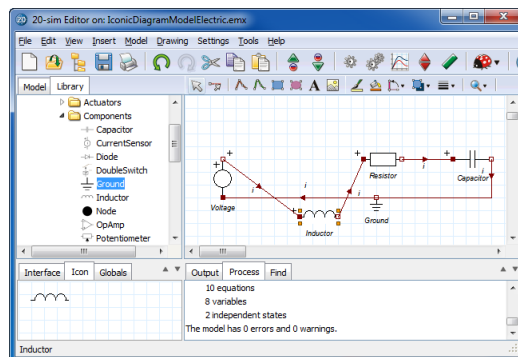

With the View menu you can show the port names.

8. Select the model *Inductor*.

9. Click the **F1** key or from the **Help** menu click **Current Selection** to open the help file.

As the help file explains this model has one port *p* with two *terminals p_high* and *p_low*. These *terminals* are the points where the connections with the other models are made. Therefore *p_high.u* and *p_low.u* are the voltages on both sides of the inductor (the plus sign in the model indicates the high voltage):

  p.i = p_high.i = p_low.i;
  p.u = p_high.u - p_low.u;

p.u is the internal voltage difference and *p.i* is the current that flows through the inductor. The internal equation of the inductor is

  p.i = (1/L)int(p.u);

10. From the **Model** menu click **Go Down**.

Now we see the internal model description. In 20-sim we can inspect the value of every variable in an equation model.

11. Put your **mouse pointer** on top of a variable, until a little window pops-up.

It should look like the figure below (don't worry when this value is different, this is just an example value):
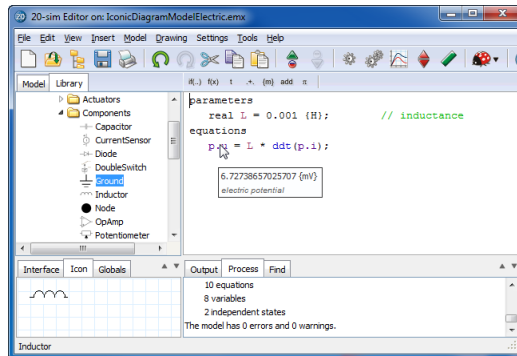

Put your mouse pointer on any variable, to inspect its value.

As you can see the voltage *p.u* is 6.72 [mV] which means:

p.u = p_high.u - p_low.u = 6.72 [mV];

12. From the **Model** menu click **Go Up**.

13. From the **Model** menu select **Show Variables**.

14. In the *Variable Chooser* window, select the *Inductor* model.

Now you can see all the variables of the inductor model.
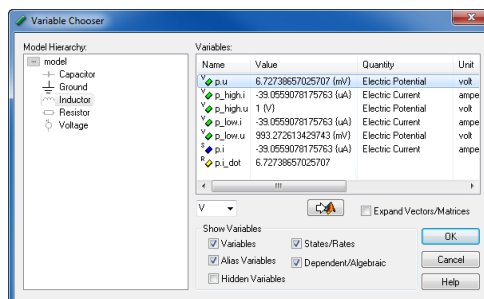

Variable values can also be inspected in the Variable Chooser.

Note that *p_low.u* = 993 [mV] (equal to the voltage we found at the start of this topic), *p_high.u* = 1.0000 [V] and again *p.u* = 6.72 [mV].

Causality

15. Close the *Variable Chooser*.

16. From the **View** menu de-select all options and select **Causality Info**.

Your model should look like:
The causal order of the model equations can be visualized with the Causality Info option.

The arrows at the connections show the computational direction of the voltages and currents. This computational direction is called *causality*. The numbers show the order in which the causality is computed in 20-sim. For the *Inductor* model this means that at both sides current is computed as function of the voltages. Combining the previous findings, we can conclude that the following equations are derived:

p.u = p_high.u - p_low.u
p.i = (1/L)*int(p.u);
p_high.i = p.i;
p_low.i = p.i;

As you see with *Causality Info* command you can manually inspect computational order of your model equations. This might be helpful when 20-sim has problems finding the correct computational order and you have to find the cause of these problems.

As you have seen the *View* menu of the 20-sim Editor is an important aid for understanding an iconic diagram. We advise you to use the options of this menu, as much as possible, when creating iconic diagrams. In the next section we will create a simple mechanical system. We will apply the options of the *View* menu, to correctly interpret the simulation results.

7.3   Iconic Diagram (Mechanical)

In this topic you will learn how to enter a simple mechanical system in the form of an Iconic Diagram. We consider the mechanical system of the figure below.
Spring damper system.

This system can easily be transferred into the iconic diagram model shown below.
The equivalent 20-sim model.

1. Open 20-sim and select **File**, **New** and **Graphical Model** and make sure that 20-sim is in *Debug Mode* 🐞.

The right part of the *Editor* will now allow you to enter graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*.

2. Put the mouse pointer in the middle of the *Graphical Editor*.

3. From the right mouse menu or from the **Insert** menu select **Insert**, **Knot** and **Node**.

This adds a an iconic diagram *node*.

4. **Insert** a second *node*.

5. **Drag** the following library models to the *Graphical Editor*:

model library	model
Library\Iconic Diagrams\Mechanical\Translation\Components	*Damper*
Library\Iconic Diagrams\Mechanical\Translation\Components	*FixedWorld*
Library\Iconic Diagrams\Mechanical\Translation\Components	*Mass*
Library\Iconic Diagrams\Mechanical\Translation\Components	*Spring*
Library\Iconic Diagrams\Mechanical\Translation\Actuators	*Force*
6. **Select** the *Force* model and **rename** it to *Fg* (select **Settings** menu and **Submodel** command).

7. Do so with all the submodels and use the names given in the iconic diagram at the top of this topic.

8. **Select** the *FixedWorld* submodel.

9. From the **Drawing** menu select the **Rotate Left** command.

10. Do the same for the *Spring*, *Damper* and *Fg* submodels.

11. **Select** the *Fg* submodel. From the right mouse menu select **Show Name** and **Right**.

12. Do so with all the other submodels.

13. From the **View** menu select **Show Terminals**. Now your model should look like:
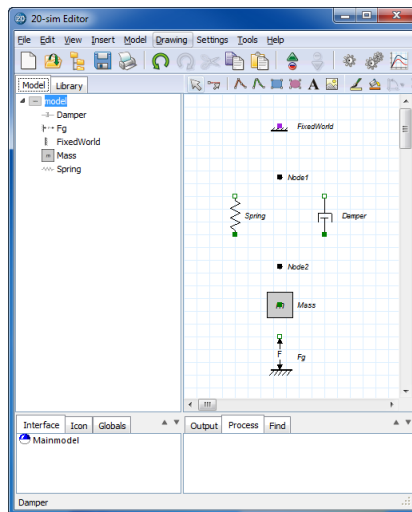

All the models have been dropped in the Graphical Editor.

14. In the **taskbar**, choose the **second left button** (the mouse pointer with line). This is the *connection mode* button.

15. **Select** the model *Fg* and then the model *Mass.*

Now a connection will be created between the two submodels.

16. Enter the other connections until your model looks like:
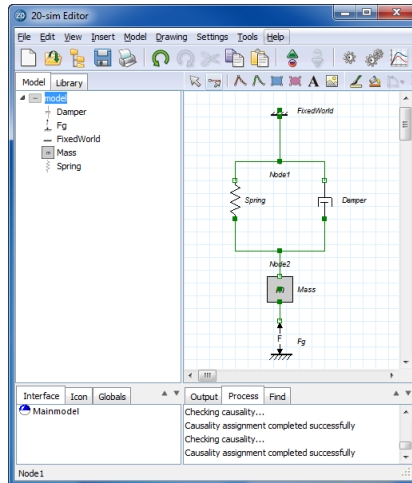

With the proper connections the model is ready for simulation.

The connections of an iconic diagram represent the power flow between the components. The power flow in iconic diagrams is always characterized by two variables, across and through (in this model velocity and force). The velocities are all defined with respect to a general reference (fixed world, v = 0). The forces are defined with respect to the various components.

17. From the **View** menu select **Orientation Info**.

Your model should look like:
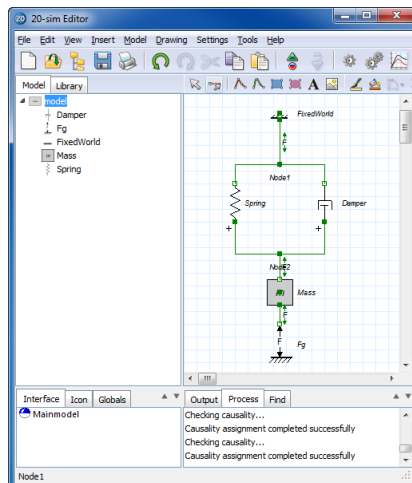

With the View menu you can show the orientation that 20-sim has chosen for positive forces.

The orientation of the forces is now shown in the Editor by the little arrows →*F*← and →*F*←. When the arrows point inwards →*F*←, this means a positive force will pull both ends of the connection together. When the arrows point outwards ←*F*→, this means a positive force will push both ends of the connection outwards.

The connection between the *Fg* model and the *Mass* model show outward pointing arrows ←*F*→. This means that a positive force will push the mass upwards and a negative force will pull the mass down. To generate a pulling gravity force we will therefore use a negative force value in the next topic.

18. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings. If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation or submodel.

19. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *IconicDiagramModelMechanical.emx*.

If you have problems creating the model, load the model *Iconic Diagram Mechanical* from the *Getting Started\Iconic Diagrams* section of the library.

Simulation

20. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the *Simulator* window. We will proceed with this window.

21. In the *Simulator* window, select from the **Properties** menu the **Parameters** command and change the default parameter values to:

Damper\d	1
Mass\m	1
Spring\k	2
Fg\F	-9.81

22. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	15
Method	Euler
Step Size	0.2

23. In the From the **Properties** menu select the **Plot** command.

24. Select the **Plot Properties** tab and change the title to **Iconic Diagram Mechanical**.

25. Select the **Y-axis** tab and click **Choose** to open the Variable Chooser.

26. Select the variable *Spring\x* from the list and click **OK**.

27. Change the label to *x*.

28. Set the following values:

        Tick Style Properties
        Tick Style   Diamond Closed
        Min. Distance (pixels)   2
        Color   Red

        Scaling
        Scaling   Manual
        From   -10
        To   10

29. Close the *Plot Properties Editor* by clicking the **OK** button.

30. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
The simulation results.

31. From the **File** menu click **Save**.

If you have problems creating the model, load the model *Iconic Diagram Mechanical* from the *Getting Started\Iconic Diagrams* section of the library.

8   Bond Graphs

8.1   Bond Graph Model

In the previous sections you have learned how to enter equation models and block diagram models. You have also learned how to enter hierarchy into a model. In this lesson we will explain the basics of bond graph modeling in 20-sim. The lesson is meant for users interested in bond graph modeling. If you are not interested in bond graph modeling, we advise you to skip this section and continue with iconic diagrams.

Bond Graph Model

We consider the mechanical system of the figure below.
A mass with spring and damper.

This system can easily be transferred into the bond graph model shown below.
Bond graph model of the mass-spring-damper system

1. Open 20-sim and select **File**, **New** and **Graphical Model** and make sure that 20-sim is in *Debug Mode* .

The right part of the *Editor* will now allow you to enter graphical models. That is why we have named this part of the *Editor* the *Graphical Editor*.

2. Put the mouse pointer in the middle of the *Graphical Editor*.

3. From the right mouse menu or from the **Insert** menu select **Insert**, **Knot** and **OneJunction**.

This adds a *1*-junction.

4. Right click on this 1-junction and select the **Show Name** menu and the **None** command to hide the name of the 1-junction.

5. Go to the left of the *Editor* and click the **Library tab**.

6. Drag the following library models to the *Graphical Editor*:

model library	model
Library\Bond Graph	*C*
Library\Bond Graph	*I*
Library\Bond Graph	*R*
Library\Bond Graph	*Se*

6. Select the *Se* model. From the **Settings** menu select the **Submodel** command.

This will open the *Model Properties Editor*.

7. **Rename** the model to *Fg*. Do so with all the submodels and use the names given in the bond graph at the top of this topic.

8. **Select** the *C* model and from the right mouse select the **Show Name** menu and the **Right** command.

This will put the element name to the right of the element.

9. Do so with the other elements (except for the **Se** element) until your model looks like:
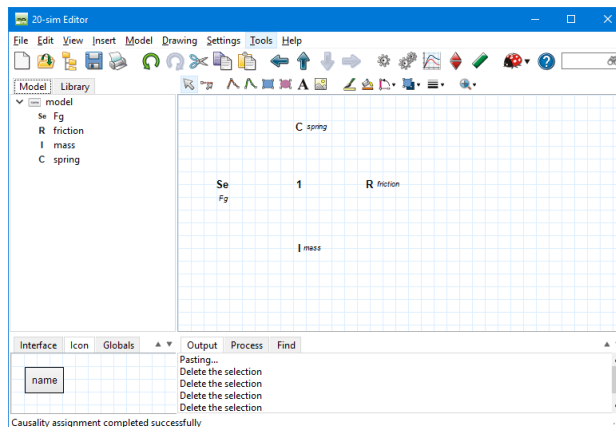

The bond graph elements in the Editor.

10. In the **taskbar**, choose the **second left button** (the mouse pointer with line). This is the *connection mode* button.

11. Select the model *Fg* (left mouse click on top of the element) and then the *1*-junction (left mouse click on top of the element).

This will create a connection between both elements:
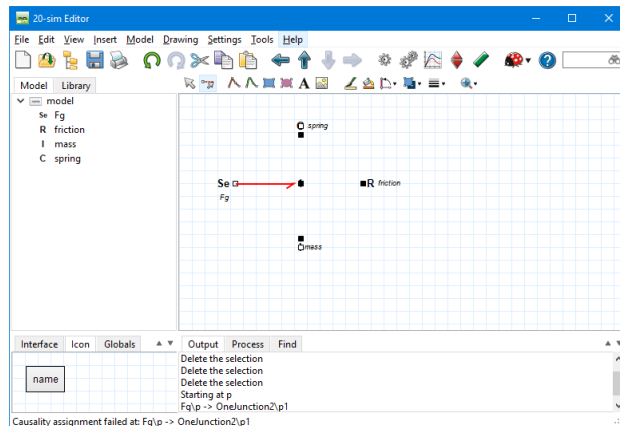

The red color of the bond indicates a conflict. In this case more bonds need to be inserted.

The bond is drawn red, which means causality could not be assigned. Don't worry! This is because 20-sim has an on-line causality assignment and notices there is only one bond connected to the *1*-junction.

12. Create a bond between the **1**-junction and the submodel *spring*.

Now your model should look like:
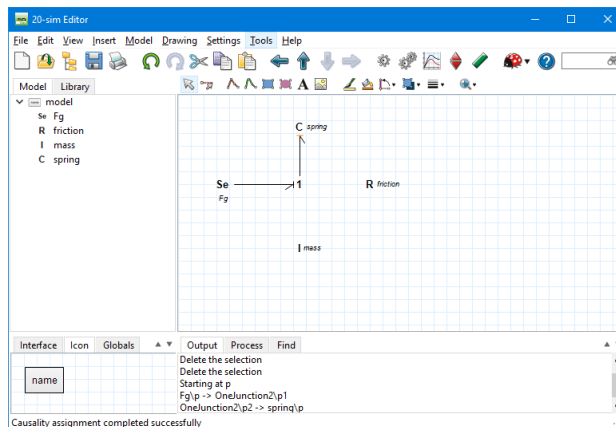

The orange stroke indicates a non-preferred causality.

The bond to the **C** model has an orange causal stroke. This means that the *C* model in this configuration has a non-preferred causality.

13. Enter the other connections until your model looks like:
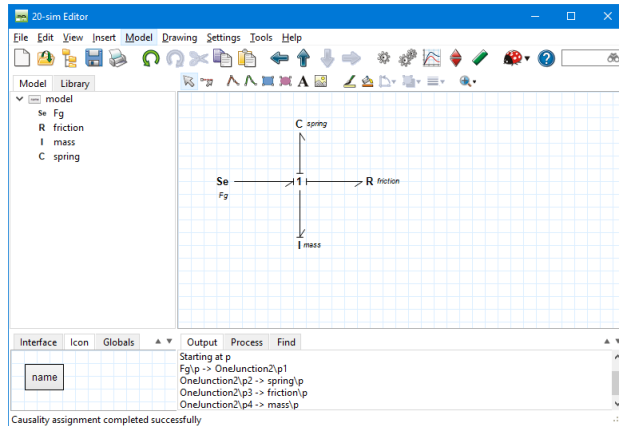

The complete bond graph model.

14. From the **Model** menu select the **Check Complete Model** command.

Now the complete model will be checked. If the model is correct at the bottom of the *Editor* the *Process tab* should show a message indicating 0 errors and 0 warnings. If any errors are found, a message window pops up, showing the errors which 20-sim has found. You can click on the error in the *Process tab* to highlight the corresponding equation.

15. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *BondGraphModel.emx*.

If you have problems creating the model, load the model *Bond Graph Model* from the *Getting Started\Bond Graphs* section of the library.

Simulation

16. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

This opens the *Simulator* window. We will proceed with this window.

17. In the *Simulator* window, select from the **Properties** menu the **Parameters** command and change the default parameter values to:

friction\r	1
Fg\effort	-9.81
Mass\i	1
Spring\c	0.5

18. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	15
Method	Euler

Step Size	0.2

19. Select from the **Properties** menu the **Plot** command.

20. Select the **Plot Properties** tab and change the title to **Bond Graph Mainmodel**.

21. Select the **Y-axis** tab and click **Choose** to open the Variable Chooser.

22. Select the variable *spring\state* from the list and click **OK**.

23. Change the label to *x*.

24. Set the following values:

Tick Style Properties

Tick Style	Diamond Closed
Min. Distance (pixels)	2
Color	Red

Scaling

Scaling	Manual
From	-10
To	10

25. Close the *Plot Properties Editor* by clicking the **OK** button.

26. From the **Simulation** menu select the **Run** command to start the simulation. The result should look like the figure below.
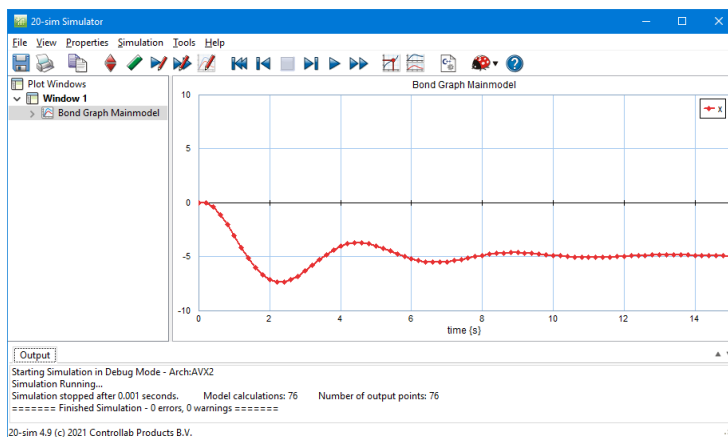

The simulation results.

27. From the **File** menu click **Save**.

If you have problems creating the model, load the model *Bond Graph Model* from the *Getting Started\Bond Graphs* section of the library.

9   3D Mechanics Toolbox

9.1   3D Mechanics Toolbox

The 20-sim *3D Mechanics Toolbox* provides you with the tool that makes 3D dynamic modeling easier, the *3D Mechanics Editor*.

Bodies

You can create 3D models by dragging bodies in a 3D workspace. The representations of each body can be changed to a sphere, block, cylinder etc. Furthermore, colors can be changed and descriptions can be added. The size and shape of a body are merely for representation, a body is fully characterized by its inertia coefficients and mass.
The 3D Mechanics Editor helps you to create 3D models easily.

Joints

Bodies are interconnected by the use of joints. Several joints are present in the library, divided in two groups, rotational joints and translational joints. These joints can also be drag and dropped on the workspace. Constraints can be added to create closed loop systems like four bar mechanisms or Stewart platforms.

Interface

The user interface has 4 different modes in which you can select, connect, translate and rotate bodies and joints. Much effort is done to keep the graphical user interface as natural as possible. Multiple views are supported. Besides the 3D environment, you can see 2D intersections in the xy xz, and yz plane.

Models

The 3D Mechanics Editor can generate a 20-sim model from your 3D model. This 20-sim model comprises all dynamics and kinematics of the model. Forces can be applied to the joints or on to each body directly. You can also couple springs and dampers from the mechanics library in 20-sim, to the joints, because the whole model is port-based. Gravity can be set as an external force. Eventually, the dynamic response of the complete model can be shown by the *3D Animation Editor*.

9.2   Double Pendulum

Introduction

In this section we will use the *3D Mechanics Editor* to create the model of a double pendulum. In this editor you can define the geometry of the pendulum and inspect the possible movements. From the *3D Mechanics Editor* we will generate a 20-sim model that incorporates the equations of motion and a 20-sim scenery for the animation of the pendulum.

The pendulum model that we will create has actuated joints. This means we can apply a torque to the joints. In 20-sim, we will insert the pendulum model and connect passive actuation through dampers. After that we will simulate the model and show a 3D Animation, to see how the damping affects the pendulum behavior.

Inserting Components

1. Open 20-sim and select **File**, **New** and **Graphical Model**.

2. In the Editor from the **Tools** menu select **3D Mechanics Toolbox** and **3D Mechanics Editor**.

A 3D mechanics model will be inserted in the *Editor* and the 3D Mechanics Editor will be opened:
The 3D mechanics Editor.

Like the *Editor, th*e *3D Mechanics Editor* consists of several parts:

- *Model / Library section*: This is the part at the middle left. The *Model* tab opens the *Model Browser* which shows a hierarchical composition (all the elements) of the model that is created in the *3D Mechanics Editor*. The *Library* tab opens the *Library Browser* which shows all the objects that can be used.

- *Object Properties*: This is the part at the right that in the picture above shows "No Selection". As soon as an object is selected, it will show the name of that object and allow you to change the object properties.

- *Object Representation*: This is the part at the right that in the picture above shows "None". As soon as an object is selected, it will show the name of that object and allow you to change its representation.
- *Graphical Editor:* This is the space with the checker board at the right. In this editor you can drag objects and create models.
- *Messages tab*: This is the part at the right bottom, where all messages are shown.

The Editor has several modes of operation which are indicated by the buttons at the right of the editor:

button	mode	description
	Translation Mode	*Use this mode to translate selected objects*
	Rotation Mode	*Use this mode to rotate selected objects*
	Connection Mode	*Use this mode to connect objects*
	Camera Movement	*Use this mode to change the camera view*

You can choose to make objects transparent:

button	mode	description
	Ghost Mode for Bodies	*Click this button to make all bodies transparent*
	Ghost Mode for Joints	*Click this button to make all joints transparent*
	Ghost Mode for Sensors / Actuators	*Click this button to make all sensors and actuators transparent*

The Editor is in *translation mode*, which is suited for dragging and dropping components. We are going to insert the necessary components to construct a double pendulum.

3. Click on the Library tab.

4. In the **Library** click on **Bodies** - **Body** and **drag** it to the **Graphical Editor** (the checker board).

The first body that is inserted in the *Graphical Editor* will be fixed to the floor and will not move during simulation. Our pendulum will be attached to this body.

5. **Click** on **Edit Body** button (at the left) to open the Body Properties.

6. **Rename** the body to *Base*.

7. Select the **Is Fixed World** option.
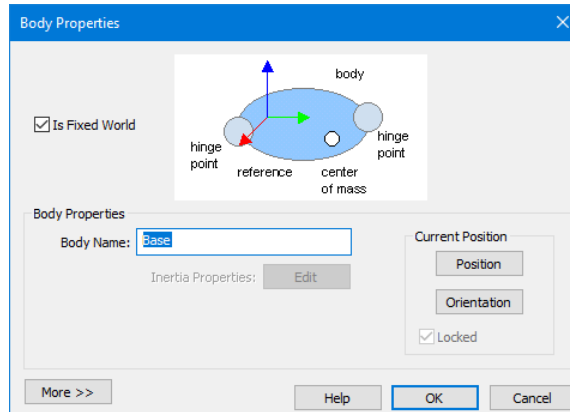

Use the Body Properties dialog to change the name of a body, its position and mass parameters.

8. Click the **Position** button and change the position to (x = 4, y = -4, z = 0).
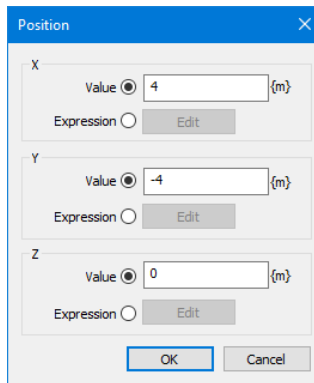

Set the position of the body.

9. **Close** the Body Properties.

Your 3D Mechanics Editor should now look like:
The model tab shows that one body (Base) is fixed to the ground (indicated by the anchor).

10. In the *Library tab* **click** on **Joints** - **Rotation** - **Actuated - X-rotation** and **drag** it to the *Graphical Editor*.

If a joint is selected, lines through the center of the joint indicate the possible movements that you can make with the body. If you click the left mouse button you can move the joint over the surface. If you press the *Ctrl-button* while keeping the left mouse button pressed, the body goes up and down.

11. **Select** the joint and **place** it next to the body like:
In Translation Mode you can move objects easily with the mouse pointer.

12. **Click** on the **Edit joint** button to open the *Joint Properties*.

13. **Rename** the joint to *Base_Arm1*.
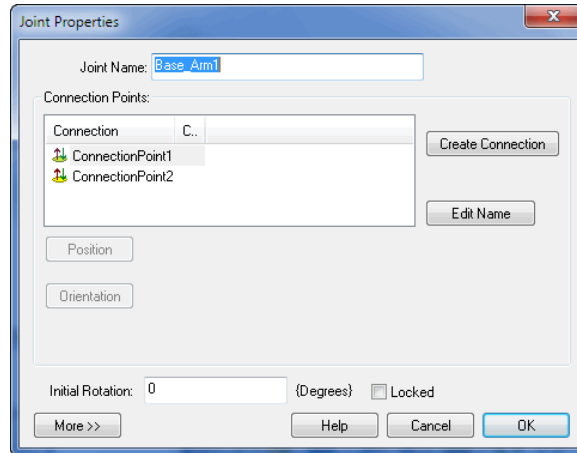

Double clicking a joint will open the Joint Properties Dialog.

14. **Close** the Joint Properties.

15. **Insert two** more **bodies** and another **actuated joint** (X-rotation) and rename the bodies to *Arm1* and *Arm2* and the joint to *Arm1_Arm2*.

Now the 3D Mechanics Editor should look like:
The model tab shows three bodies and two actuated joints.

Creating Connections

16. Click on [icon] to set the *3D Mechanics Editor* in **Connection Mode**.

Now we can define the connections by clicking on the components.

17. Put the mouse pointer on top of the ***Base*** body and **click** the **left mouse button**.

Now a dotted line should appear between the body and the mouse pointer to indicate that a connection is being defined between the body and a second component.
In Connection Mode you can create connections clicking the left mouse button.

18. Put the mouse on top of the ***Base_Arm1*** joint and **click** again.

Now the connection is made and the **Create Connection dialog** is opened. In this dialog you can define the position offset of the *Base_arm1* joint with respect to the *Base* body. As shown in the Create Connection dialog, every joint has two connections. We will choose *ConnectionPoint1* to start with.

19. Click on **ConnectionPoint1**.

20. Click on the **position button** and set the position to x = 0, y = 0, z = 0.

Now the *Create Connection dialog* should look like:
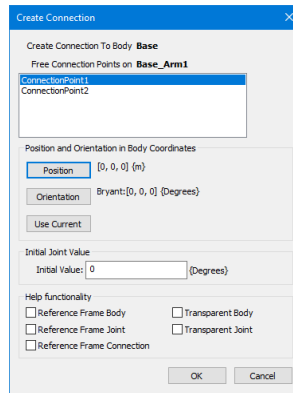

After a connection is made the Create Connection dialog is opened.

21. Click **OK** to close the Create Connection dialog.

Because we have set the offset position to zero, the *Base_Arm1* joint has the same position as the *Base* body. To better see the joint we can turn on the **Ghost Mode for Bodies**, to make the bodies transparent.

22. Click on to set the 3D Mechanics Editor in **Ghost Mode for Bodies**.

The 3D Mechanics Editor should now look like:
Use the ghost modes to make objects transparent.

23. Make the **connections** 2, 3 and 4 according to the table below:

Action	First click	Second click	Position offset
1	Base	Base_Arm1	x = 0, y = 0, z = 0
2	Base_Arm1	Arm1	x = 0, y = -2, z = 0
3	Arm1	Arm1_Arm2	x = 0, y = 2, z = 0
4	Arm1_Arm2	Arm2	x = 0, y = -2, z = 0

The 3D Mechanics Editor should look like:
All bodies are connected with joints.

24. Click on [icon] to **turn off** the **Ghost Mode for Bodies**.

Checking Motion

To see if the model was defined properly we can check it and see how it can move.

25. Click on [icon] to **set** the 3D Mechanics Editor in **Translation Mode**.

26. From the **Actions** menu, select **Check Model**.

The Message Dialog should show *Analysis Completed Successfully*. We will inspect the possible motions of the mechanism.

27. Put the **mouse pointer** on top of the *Arm1* body and click the **left mouse button**.

The *Base_Arm1* joint will show an arrow that indicates positive rotation.

28. Keep the left mouse button **pressed** an move it up and down.

The body will now rotate around the joint.

29. Repeat the movement with the *Arm*2 body to see its movement.
If the model is correctly assembled, you can inspect the motion by dragging the mouse pointer.

30. Select **Check Model** from the **Actions** menu to reset the movement.

During the checking all joint angles will be reset to their initial value. Since we have not changed the initial values (default = 0) the mechanism will return to its original set-up.

Updating to 20-sim

31. From the **Actions** menu select **Generate 20-sim model**.

A window will pop up asking you to store the model. 3D Mechanical models are stored in a separate file with the extension *3dm*. If you open a 3D Mechanics model from 20-sim, this file will be read by the *3D Mechanics Editor*.

32. Click **Yes** and store the model in a temporary directory (e.g. *C:\temp*) using the name **DoublePendulum.3dm**.

After the storage of the *.3dm* file the *Code Generation dialog* will be opened.
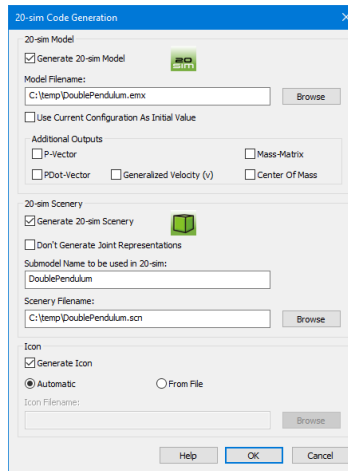

In the Code Generation dialog you can enter the settings for the generation of a 20-sim model.

A number of options can be set in this dialog:

- **Model Filename**: The 3D Mechanics Editor will automatically generate the equations that describe the double pendulum. These equations are stored as a 20-sim submodel.

- **20-sim Scenery**: In 20-sim we will show the pendulum motion in an animation. The animation is generated by the 3D Mechanics Editor and stored on file.

- **Submodel Name**: The double pendulum will be loaded in 20-sim as a submodel, with the name that can be entered here.

- **Icon**: You can choose to make a snapshot of the model (automatic) or load an image from file to be used for the model icon.

In most cases the default entries will be sufficient. We will not make any changes.

33. Click **OK** to export the model to 20-sim.

34. **Close** the **3D Mechanics Editor**.

35. You will be asked to save the model. Choose **Yes** to save it.

Editor

The 20-sim Editor will be updated with the double pendulum model. It should look like:
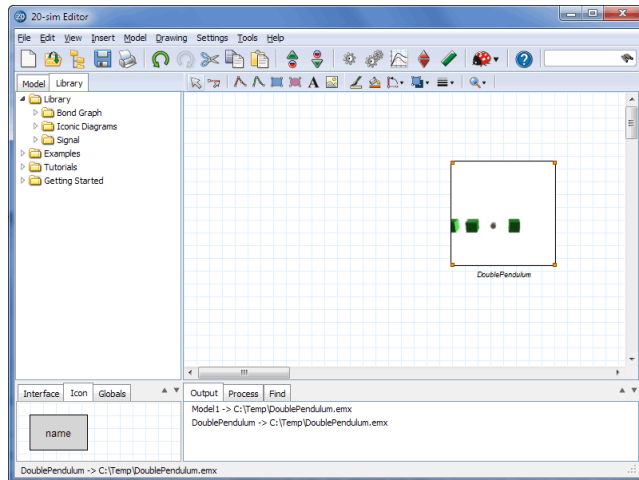

The 20-sim model of the double pendulum in the Graphical Editor.

Now it is a good time to store the model.

36. **Save** the model using the name **DoublePendulumSimulation.emx**.

37. Go to the **Library tab** and select the library **Library\Iconic Diagrams \Mechanical\Rotation\Components**.

37. Insert the model *Bearing* twice.

38. Connect the two **bearing** models with the *Base_Arm1* and *Arm1_Arm2* ports of the **DoublePendulum** submodel.
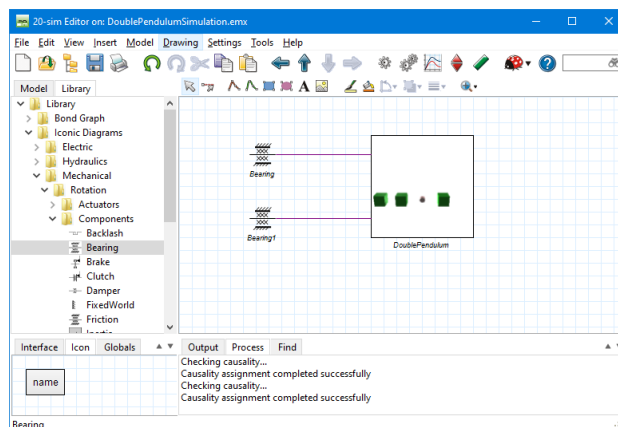

You can connect two bearing models to the double pendulum.

40. From the **File** menu click **Save**.

Simulation

41. From the **Model** menu click **Start Simulator**.

This will open the Simulator with a second window showing a 3D Animation with our pendulum. You can now set the parameters values, choose an integration method, set the plot variables etc. We will use the default parameter values and run a 3D animation.
The 3D Animation window with the double pendulum scenery loaded.

42. Click the blue Run button to run a simulation

43. Click the green Run ▶ button below the 3D Animation to replay the animation.

If you had problems creating the model, load the model *DoublePendulumSimulation.emx* from the *Getting Started\3D Mechanics Toolbox* section of the library. You should see the pendulum swinging during the simulation. Try to change the bearing parameters to find the changes in the pendulum movement. You can click the Camera 🖼 button to change camera views.

The pendulum model shows bodies as cubes with default sizes. A more elegant display would result if we could define arbitrary shapes. Moreover, we used default mass and inertia parameters. Both can be changed in the 3D Mechanics editor as will be shown in the next lesson.

9.3 Scara Robot

Introduction

In this lesson you will learn how to create and simulate the dynamic model of a SCARA robot.

A Selective Compliant Articulated Robot Arm (SCARA).

- You will expand the knowledge learned from the previous lesson, by introducing mass and inertia parameters and making a more elegant display.
- We will start by inspecting the robot, identify the links and mass and inertia parameters. Then we will introduce the 20-sim model that will be used to simulate the Scara robot. This model contains setpoint generators, controllers and drives that will be connected to the robot.
- We will proceed by entering the Scara robot in the 3D Mechanics Editor. From the 3D Mechanics Editor we will generate a 20-sim submodel that incorporates the equations of motion of the Scara robot. From the 3D Mechanics Editor you can also generate a 20-sim scenery that describes the animation of the Scara robot.
- Finally the Scara robot model will be connected to the drives and simulated.

Inspection

We start the modeling session by inspecting the Scara robot. The robot has a base with arms that can move in the horizontal plane and a load that can move vertically. The robot can thus be modeled using four bodies which are connected by joints. Between the base and the first arm, a rotational joint is mounted, which can be actuated (indicated by the torque T). Between the first and the second arm an identical joint is mounted. Between the load and the second arm a translation joint is mounted, which is also actuated (indicated by the force *F*).
Arms and joints of the Scara robot.

The robot model that we are going to create in the *3D Mechanics Editor* will therefore have to three power ports. Two power ports for the rotation joints and one for the translation joint. To simulate the robot model, we have to connect actuators to these joints.
Geometrical parameters of the Scara robot.

The geometrical parameters and the masses and inertia's can be found in the design drawings of the Scara robot. We will use the figure above.

Components

The complete model that will be used to simulate the Scara robot is shown in the figure below. The grey square with the local name robot is generated with the 3D Mechanics Editor. It represents the mechanical structure of the robot. The rotation joints are by driven electrical motors (modeled by ideal torque sources) with gearboxes. The translation joint is driven by an electrical motor (also modeled by an ideal torque source) with a spindle. The motors are controlled by PD controllers, which compare the desired motion (given by motion profile generators) with the actual position of the robot.
The 20-sim model of the drive system and the 3D robot model (grey).

1. **Open** 20-sim and **load** the model *ScaraRobot* from the *Getting Started Manual\3D Mechanics Toolbox* section of the library.

2. Use *File, Save As* to **Store** the model in a temporary directory (e.g. *C:\temp*) using the name **ScaraRobot.emx**.

As you can see, this model contains the drives and controllers for the robot. Only the mechanical part of the robot model is missing. We are going to create this part in the 3D Mechanics Editor.
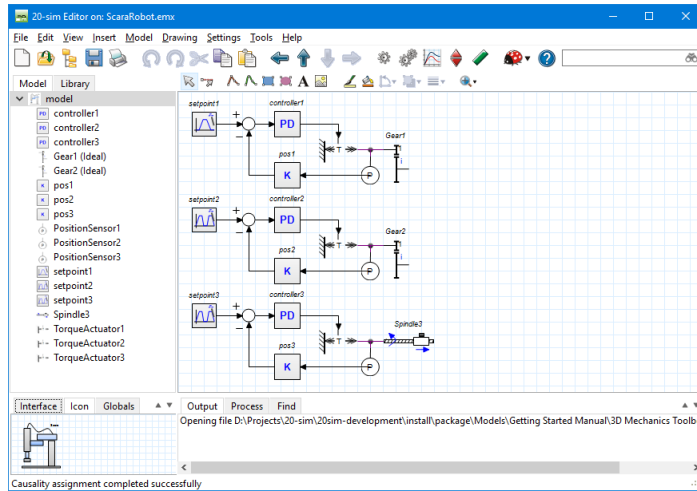

The 20-sim drive system model is already created: load ScaraRobot.emx.

3. In the 20-sim Editor from the **Tools** menu select **3D Mechanics Toolbox** and **3D Mechanics Editor**.

This will insert a 3D Mechanics model in the 20-sim *Editor* and open the *3D mechanics Editor*. The dimensions of the Scara robot are rather small. Therefore we are going to change the scaling of the 3D Mechanics Editor.

4. From the **Tools** menu in the *3D Mechanics Editor* window select **Model Settings**.

5. Change the **Size** of the **Reference Frames** to 0.1 and the **Grid Size** to 0.1 as show below.
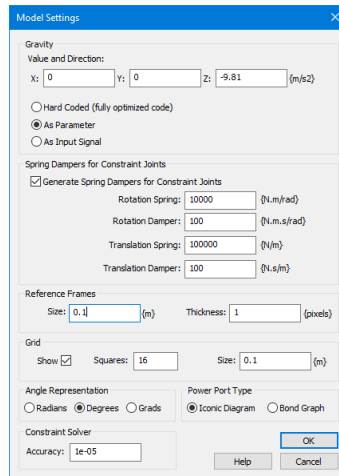

Changing the frame size.

6. Click **OK** to close the *Model Settings* dialog.

If the reference frame is too far away you can move the camera closer to the origin.

7. Change the Editor into **Camera Mode** (indicated by 📷), press the Ctrl-key and drag the mouse until a good view has been obtained.
Use the Camera Mode to change the view.

8.   Return to **Translation Mode** (indicated by 🔳).

We are going to insert the necessary components to construct the Scara robot.

9.   **Insert** the following components into the *Graphical Editor* and rename them according the table below.

Action	Component	Name
1	*Bodies\Body*	*base*
2	*Bodies\Body*	*arm1*
3	*Bodies\Body*	*arm2*
4	*Bodies\Body*	*load*
5	*Joints\Rotation\Actuated\Z-rotation*	*base_arm1*
6	*Joints\Rotation\Actuated\Z-rotation*	*arm1_arm2*
7	*Joints\Translation\Actuated\Z-translation*	*arm2_load*

 Now the 3D Mechanics Editor will look like:
For the Scara robot we need four bodies and three joints.

Representation

To make the mechanism look like a real Scara robot, we have to change the representation of the bodies. We will use the geometrical parameters of the robot.

10. **Select** the ***base*** body.

The **Edit** button of the *Object Representation* (at the left of the 3D Mechanics Editor) should now be active.

11. Click on the **Edit** button to open the **3D Representation** dialog.
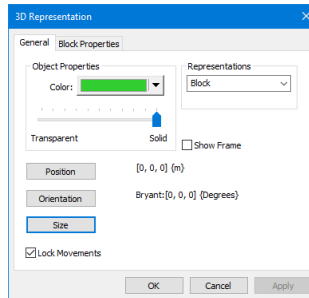

In the 3D Representation dialog you can change the looks of an object.

Using the 3D representation dialog, you can change the look of an object.

12. **Change** the representation of the *base* body according to the table below (action 1).

Action	Body	Size	Color	Representation
1	*base*	x = 0.1, y = 0.1, z = 0.5	Green	Block
2	*arm1*	x = 0.1, y = 0.5, z = 0.1	Blue	Block
3	*arm2*	x = 0.1, y = 0.4, z = 0.1	Red	Block
4	*load*	x = 0.04, y = 0.04, z = 0.5	Orange	Cylinder

13. Do so with the other bodies according to the table (actions 2, 3 and 4).

14. **Double click** on the **base** body which opens the **Body Properties** dialog.

15. Make sure this body is **Fixed to the World**.

16. Set the **Position** to x = 0, y = 0 and z = 0.25 and close the **Body Properties** dialog.

If desired, you can drag and drop the other bodies to a more favorable location like:
You can give objects arbitrary shapes and colors.

Parameters

The bodies still have default mass and inertia parameters. We will change them according to the specifications given previously.

17. **Double click** on the *arm1* body which opens the **Body Properties** dialog.

18. Click the **Edit** button of the *Inertia Properties* and change the parameters of the *arm1* body according to the table below (action 1).

Action	Body	Mass [kg]	Ixx [kgm^2]	Iyy [kgm^2]	Izz [kgm^2]
1	arm1	8	0.1	0.02	0.1
2	arm2	6	0.05	0.01	0.05
3	load	0.5	0.01	0.01	0.0005

The *base* body is fixed to the ground, which make the inertia parameters irrelevant. If you want to insert then anyway, temporary remove the *Is fixed world* option.

19. **Do the same** with the other bodies according to the table (actions 2 and 3).

Connections

To assemble the Scara robot we will create connections between the various bodies and joints.

20. **Click** on ⬚ to set the 3D Mechanics Editor in **Connection Mode**.

Now we can define the connections by clicking from joints to bodies. To make the joints better visible, we will use the Ghost Mode for bodies.

21. **Click** on ⬚ to set the 3D Mechanics Editor in **Ghost Mode for Bodies**.

22. Make the **connections** according to the table below:

Action	First click	Second click	Connection Point	Position
1	*base_arm1*	*base*	ConnectionPoint1	x = 0, y = 0, z = 0.25
2	*base_arm1*	*arm1*	ConnectionPoint2	x = 0, y = 0.2, z = -0.05
3	*arm1_arm2*	*arm1*	ConnectionPoint1	x = 0, y = -0.2, z = -0.05
4	*arm1_arm2*	*arm2*	ConnectionPoint2	x = 0, y = 0.15, z = 0.05
5	*arm2_load*	*arm2*	ConnectionPoint1	x = 0, y = -0.15, z = 0
6	*arm2_load*	*load*	ConnectionPoint2	x = 0, y = 0, z = 0

When all bodies and joints are connected, 20-sim will start to assemble the robot. Your *3D Mechanics Editor* should now look like:
20-sim will assemble all objects as soon as they are all connected.

Checking Motion

To see if the model was defined properly we can check it and see how it can move.

23. **Click** on 🖳 to set the 3D Mechanics Editor in **Translation Mode**.

24. **Click** on 🔲 to **de-select** the **Ghost Mode**.

25. From the **Actions** menu, select **Check Model**.

The Message Dialog should show *Analysis Completed Successfully*. We will inspect the possible motions of the mechanism.

26. Put the mouse pointer on top of the *arm1* body and **click** the left mouse button.

The *base_arm1* joint will show an arrow that indicates positive rotation.

27. Keep the left mouse button **pressed** an move it up and down.

The body will now rotate around the joint.
If the model is correctly assembled, you can inspect the motion by dragging the mouse pointer.

28. Repeat the movement with the *arm2* and the *load* bodies to see their movements.

Updating to 20-sim

29. From the **Actions** menu select **Generate 20-sim model**.

A window will pop up asking you to store the model.

30. **Store** the model in the same temporary directory as the 20-sim model (e.g. *C: \temp*) using the name **Robot.3dm**.

After the storage of the *.3dm* file the *Code Generation dialog* will be opened.
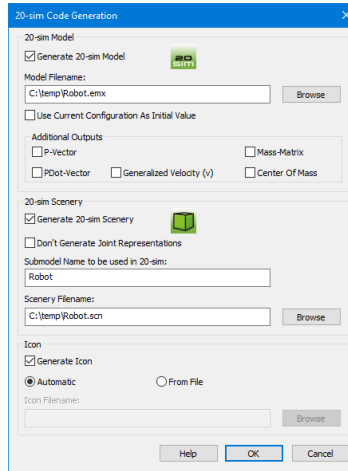

In the Code Generation dialog you can enter the settings for the generation of a 20-sim model.

31. Click **OK** to export the model to 20-sim.

32. **Close** the **3D Mechanics Editor**.

33. You will be asked to save the model. Choose **Yes** to save it.

Editor

The 20-sim Editor will be updated with the double pendulum model. It should look like:
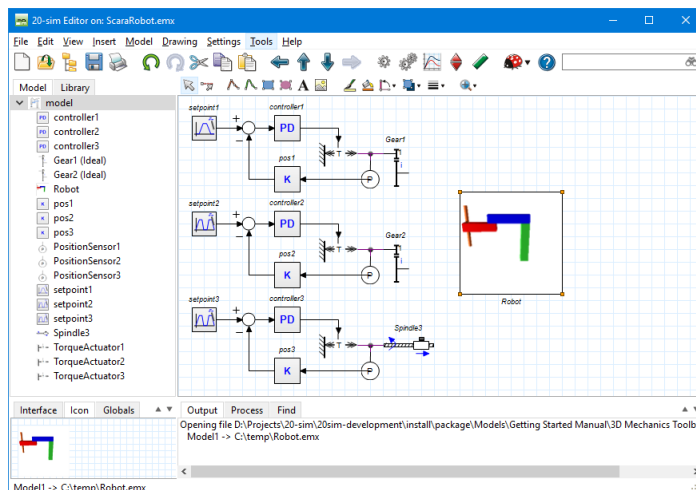

The 20-sim model of the drive system and the robot model.

Now it is a good time to store the model.

34. **Save** the model.

If you had problems creating the model, load the model *ScaraRobotSimulation.emx* from the *Getting Started\3D Mechanics Toolbox* section of the library. If you look at the *Robot* model, you can see that it has three ports. One for the *arm base_arm1* joint, one for the *arm1_arm2* joint and one for the *arm2_load* joint. We are going to connect these joints to the actuators.

35. **Connect the actuators** to the robot model (*Gear1* to *base_arm1*, *Gear2* to *arm1_arm*2 and *Spindle3* tot *arm2_load*), until the model looks like:
The robot model is connected to the drive trains.

Simulation

36. From the **Model** menu click **Start Simulator**.

This will open the *Simulator*. As you can see a predefined experiment is loaded, showing a plot with setpoint and position variables. The 3D animation is filled automatically with the generated scenery file.
3D Animation of the Scara robot.

37. Click the **Run** ▶ button to start a simulation and show the corresponding animation.

38. You should see the robot move during the simulation. You can click the **Camera** button to change camera views.

You can also show the robot animation in the main Simulator window. Try to insert a 3D Animation plot. You must open the 3D mechanics model and generate a 20-sim model (see number 29) to make it effective.

9.4 Contact Modeling

Introduction

In the previous section, we have seen how to create a dynamic model of a robot with *3D Mechanics Editor* using Scara Robot. This section describes how to create a model with some basic contact in it.

In order to explain contact modeling, we use a model of a two wheel robot, that should balance itself. It is a small "Segway" robot as shown below. The contact of the wheels with the ground are modeled. At the end, the robot should be able to drive in straight line while balancing itself.
Model of two wheel "segway" robot

Model of the Robot

Assumptions
The following assumptions are made during modeling.
- The ground is a horizontal plane where where z==0.
- The robot wheels will always stay level w.r.t. the ground.

Geometry
The robot will have the following geometry:
- The main body will be modeled by a cube with mass=1{kg}
- The size of the main body (cube) is 10 {cm} in all directions.
- The wheels will have a radius of 4{cm}.

- The width of the wheels will be 2{cm}
- The mass of each wheel is 0.5 {kg}
- The geometry of the wheel is a cylinder.
- Connection of wheels is made at 2.5 {cm} distance from the bottom of the cube

Step 1: Modeling main body

1. First start 20-sim.

2. In the 20-sim Editor from the **Tools** menu select **3D Mechanics Toolbox** and **3D Mechanics Editor**.

This will insert a 3D Mechanics model in the 20-sim *Editor* and open the *3D mechanics Editor.*

3. From the *Library* tree in *3D Mechanics Editor*, drag a **Body** to the workspace.

4. Select the body and click **Edit Body**, as shown below, and change the name to **'carBody'**.
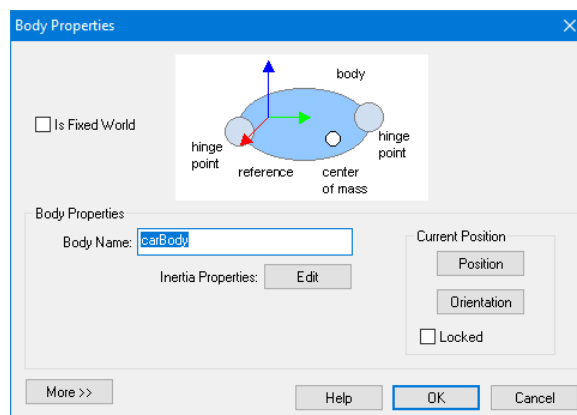

Edit body dialog

5. Then press the **Edit** button and edit the *Inertia* and *Mass* properties for this object.

Our body has a mass (*m*) of 1{kg} and a width (*w*), height (*h*) and depth (*d*) of 10{cm}. The inertia can therefore be calculated as:

Solid cuboid of height *h*, width w, and depth *d*, and mass *m*

$$I_h = \frac{1}{12}m\left(w^2 + d^2\right)$$
$$I_w = \frac{1}{12}m\left(h^2 + d^2\right)$$
$$I_d = \frac{1}{12}m\left(h^2 + w^2\right)$$

Inertia calculations

Substituting the *m*, *w*, *h* and *d* values, we get:

$$I_h = I_w = I_d = 1/12 * m * (h^2 + w^2) = 1/12 * 1 * (0.1^2 + 0.1^2) = 0.001667$$

In our case, I_h , I_w and I_d correspond to I_{xx}, I_{yy} and I_{zz} respectively.

Mass and inertia properties

6. Press **OK** on this dialog, and then **OK** on the Body Properties Dialog.

Now the shape of the cube must be set that it represents indeed a cube of 10{cm}.

7. To change the representation, press the **Edit** Button in the *Representation* section at the left of the editor.

This opens a dialog shown below with which we can choose the color, shape and size of a body. It is important to know that this is indeed only a representation. Any change made here does **NOT** influence the dynamic behavior of the model, but only the appearance.
Edit representation dialog

8. Press the **Size** button, and for every direction choose 0.1{m} and click **OK**.
Changing size

The color of the body can also be changed with this dialog.

9. Choose a color you like and press OK to close.

If the body is not visible anymore, you can move the camera closer to the object by moving the mouse while pressing the Ctrl-key.
Now our worksheet will look like this:
The grid is currently a square of 1 {m} which is a too big for our model.

10. To change the grid, choose from the **Tools** menu **Model Settings.** The dialog shown below opens.
Here you can change the size of the reference frames, and the grid. Change both to 0.1 {m}. The scenery then looks like as shown below.
Step 2: Inserting left wheel

Using similar steps followed, we insert a body for the left wheel. The size of the newly added body is now already scaled by 0.1. This is because of the settings for the reference frame size we changed in the previous step.

11. Change the representation to be a cylinder with a radius of 4 {cm} and height of 2 {cm} as shown below.
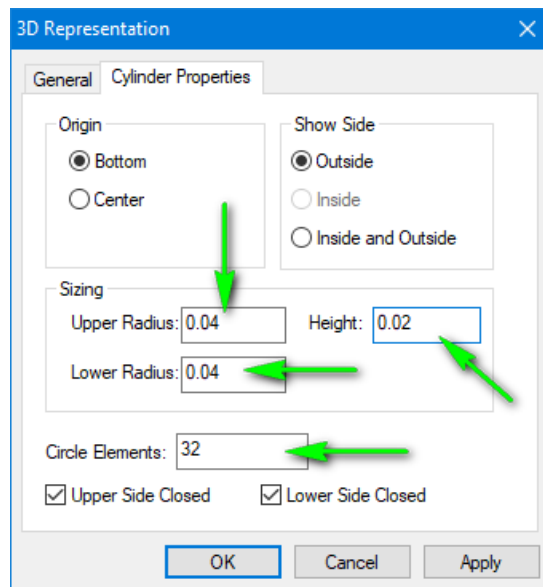

12. Press **Ok** to apply the settings. The scenery will now look like this:
Cylinder representation with wrong scaling

Not exactly what we expected, but it can be explained: Because we changed the size of the reference frames to be 0.1, all new bodies inserted will have a scaling of 0.1 in all directions. So by setting the exact dimension of the cylinder in the *Cylinder Properties*, all those are now scaled by 0.1.

13. To adjust the setting, open the representation of the cylinder and change the *scale* back to 1. It will now look like this:
Cylinder representation with correct scaling

We see that the orientation of the cylinder is such that it is lying down.
Ultimately, we need the wheel to be connected to the left side of the body with y-coordinate -0.5 and rotate in y-axis. For that the representation should be adjusted accordingly.

14. Open the *cylinder representation* again and change the *orientation* in x-axis to 90-degrees.
Orientation changed to 90-degrees in x-axis

You see that it has rotated to the left (positive angle) and that the origin is at the bottom.

15. Change the color of the cylinder to purple (Red, Green, Blue = 153, 85, 187) to indicate Left Wheel.

We now have the correct representation, we will go ahead and change the body properties.

On Wikipedia we can find the following for calculating the inertia of a cylinder.
We are rotating over the y-axis, so take that into account. Also in the picture the reference frame is at the center of the cylinder, but we have it at the bottom.

16. Open the Body Properties and change the name to **LeftWheel**.

Substituting for mass (m) of 0.5 {kg}, height (h) of 0.02 {m} and radius (r) of 0.04 {m}, the inertia's we can be calculated as the following.

$$I_y = \frac{mr^2}{2} = \frac{(0.5*0.02^2)}{2} = 0.0001 \, kg.m^2$$

$$I_x = I_z = \frac{1}{12} m(3r^2 + h^2) = \frac{1}{12} * 0.5 * (3 * 0.02^2 + 0.02^2) = 6.666667 * 10^{-5} \, kg.m^2$$

In the Inertia Properties, we can also specify the location of the center Of Mass w.r.t. the body reference. Since the center of mass is really at the center, and we have our body reference at the right side. The position offset is 1{cm} to the left.

17. Fill in the calculated inertia values and position offset in the dialog as shown below.
Step 3: Connecting the left wheel

We're going to attach the left wheel to the car body using a joint that rotates over the y-axis. We want to be able to actuate this joint.

18. Choose the *Actuated Y-Rotation Joint* from the library and drag the joint to the workspace.
19. Now set the 3D Mechanics Editor in **Connection Mode** by pressing the Space Bar, or by selecting the *Connection Mode* icon in the right button bar.

Now we want to connect the wheel to the body. The joint has two connection points. We are going to connect the first connection point to the *CarBody* and the second connection point to the *LeftWheel*.

20. Start connecting by dragging from the CarBody to the Joint.
Once you release your mouse left button when you selected the joint the following dialog will appear:
At the top, it shows that a connection is made from *CarBody* to *RotationJointY1*. We're using *ConnectionPoint1* to make the connection.
The position and orientation must be made w.r.t. the body coordinates.

21. The orientation is the same as the body and is therefore set to zero. The position offset is [x,y,z] = [0, -0.05, -0.025]

In the scenery still nothing happens, since the joint is not yet connected to the wheel. So we will do the same action but now for the connection to the wheel.

22. Choose the position as [0, 0, 0] and the orientation also [0, 0, 0].

Now the model will look like this.
Step 4: Inserting right wheel

The easiest way to create the second wheel is by copying the first wheel.

23. Select the left wheel and press Ctrl-C and Ctrl-V. Or choose *Copy and Paste* from the *Edit* menu.

A new wheel is inserted.

24. Change its name from *LeftWheel2* to **RightWheel** and it's color to **red**.
Step 5: Connecting the right wheel

24. Connect a second Actuated Y-Rotation Joint this wheel just like with the first wheel. Make sure the settings are set as shown below.
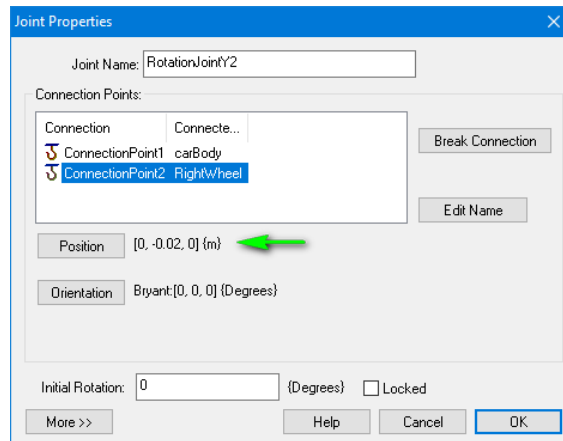

Now it will look like this.
At the left side of the editor, you can select the model tree by pressing the tab with **Model**. Here you can see that the joints have the name *RotationJointY1* and *RotationJointY2*.

25. With the right mouse button select **Joint Properties**. A dialog will open, here you can change the names of the joints to **LeftWheelJoint** and **RightWheelJoint**.
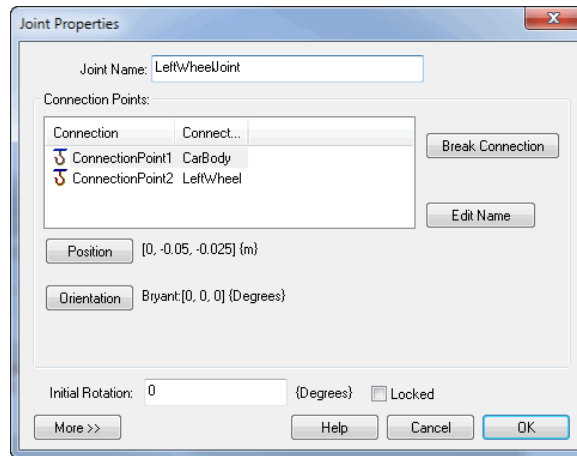

Step 6: Simulating the model

At this point we have enough information to make a simulation.

26. Press the 20-sim icon in the button bar (see figure below) in order to generate the 20-sim code.

First you will get the question:
27. Click **Yes** and choose a location and name. e.g. TwoWheelRobot3D.3dm for your .3dm model.

This name MUST be different from our 20-sim model name later on. Once you chose your name, the Code Generation Dialog will open. It will show the following:
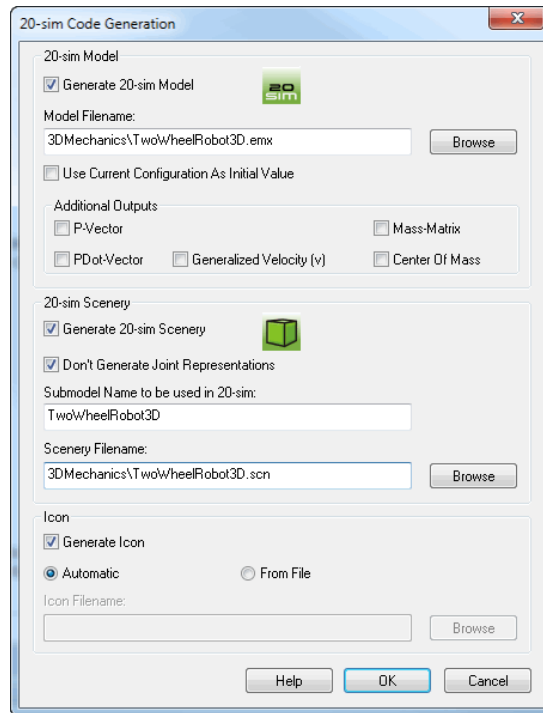

28. Press **Ok**, and 20-sim will automatically update it's icon and pop to the front.
If we look at the interface of this model (right mouse click: select **Edit Interface**) we see that there are two ports:
Just close the dialog, since we don't have to make modifications to it.
We are now going to connect simple torques to the Joints.

29. Select **Torque Actuator** from the iconic Diagram library and drag two of them on the worksheet.
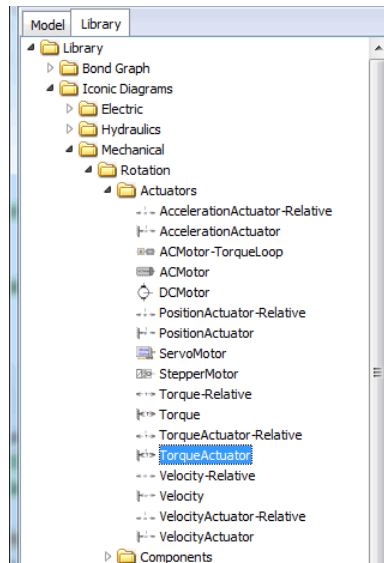

30. Change the names of the Torque Actuators to **LeftWheelTorque** and **RightWheelTorque**.

Now connect the actuators to the TwoWheelRobot3D sub-model. Two constant source sub-models are used as an input to the torque actuators.
31. Now press the **start simulator** button and the *simulator window* will open together with the *3D animation window*.
32. Now press the run button. And then the replay animation.

You will see that the car will just drop through the floor. Therefore, it is now time to add ground contact.

Step 5: Adding ground contact

To add ground contact, go back to the 3D Mechanics Editor.

Determining the lowest point of the wheel

33.From the library choose H-Matrix from the Sensor\Position&Orientation\Orientation.
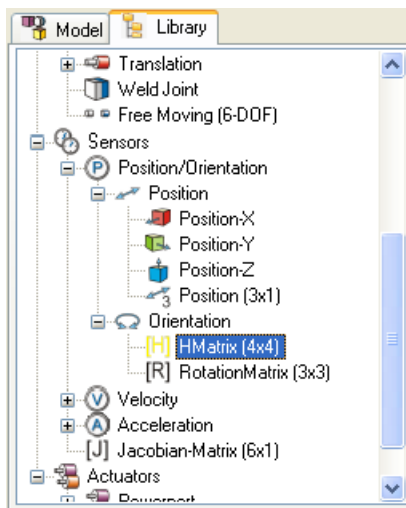

This will return a 4x4 matrix giving the position and orientation of a specific point on the car.
We're going to connect it to the center of each wheel. The idea is, if we know the center of the wheel, we can subtract the radius of the wheel in z-direction to obtain the lowest point of the wheel.

34. Drag the H-Matrix and change the name into **LeftWheelAbsH**. Then connect it to the left wheel just like you connected the joint. Since the body reference is at the side of the cylinder we want to place it really in the center, by giving it an offset of [0, -0.01, 0].

35. Repeat this action for the right wheel and change the name to **RightWheelAbsH.**

When we generate a 20-sim model again we now have two additional ports that give the H-Matrices for the left wheel and right wheel. By subtracting the radius of the wheel in z-direction we get the lowest point. This will be done in 20-sim.

The ground contact

The ground contact is modeled by applying a force upwards which is dependent on position. The force must be perpendicular to the floor.
We do this by applying a *force Actuator* also at the same location as the H-Matrix sensor.

36. From 3D mechanics Select the **Torque & Force** actuator from the library.
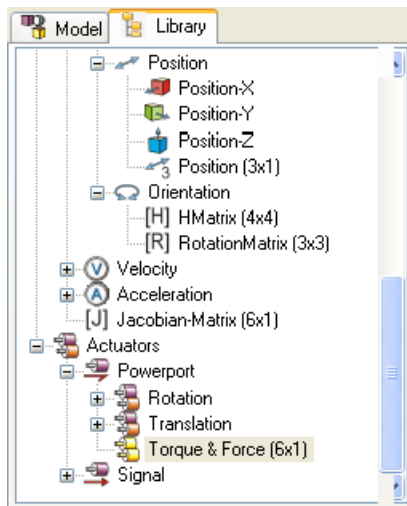

37. Drag it to the workspace and rename it to **LeftWheelContact.**

Note: Make sure that the *Port Properties* are set to **World Coordinates**.
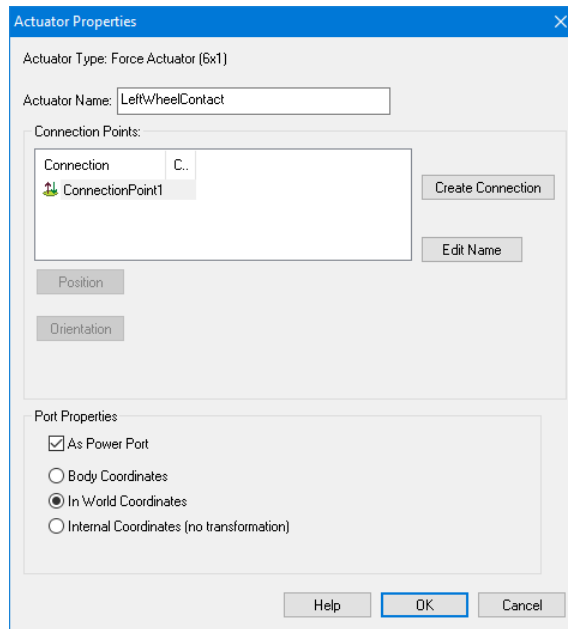

38. Connect the actuator to the *LeftWheel* at **position [0, -0.01, 0]**

39. Do the same for the *RightWheel* but connect it to **position [0, 0.01, 0]**

Now an external force can be applied to the center of the wheel, but always with the orientation of the inertial frame.

39. Generate 20-sim model again.

In 20-sim the model will be updated and 4 additional ports will appear, 2 for each wheel.

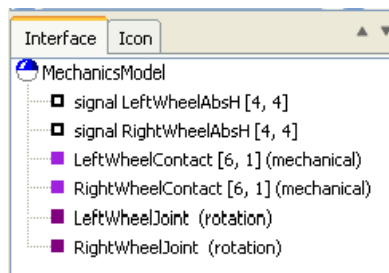

40. In 20-sim Insert a new empty submodel. (with the right-mouse button) and name it **LeftWheelContact**.

Open the interface for this model and add the following ports:

- signal port: AbsH[4,4]
- Iconic Diagram Port, mechanical: WheelContactForce[6,1]

41. Connect both ports it to the TwoWheelRobot3D model.

42. Now Double Click on the LeftWheelContact sub-model and choose a graph sub-model. A graph sub-model will show with the two ports *WheelContactForce* and *AbsH*

43. At this level, insert yet another new sub-model with name **Transformations**.

44. Open the Interface editor for this sub-model and add the following ports:

- signal port: AbsH[4,4]
- Iconic Diagram Port, mechanical, Orientation Output, Causality: Fixed Force Out: WheelContactForce[6,1]
- signal port, Orientation Output: zLowestPosition
- Iconic Diagram Port, mechanical, Causality: Fixed Force In (Fixed velocity out): ForceX
- Iconic Diagram Port, mechanical, Causality: Fixed Force In (Fixed velocity out): ForceY
- Iconic Diagram Port, mechanical, Causality: Fixed Force In (Fixed velocity out): ForceZ
45. Connect the AbsH port and the WheelContactForce.
46. Double Click on the *Transformations submodel*. Choose *equation sub-model* and enter the following.

```
parameters
        real global g_radius; //radius of the wheel
variables
```

```
        real LowestPointAbsH[4,4];

        real AbsHinverse[4,4];
        real invAdjointH[6,6];
        real WheelWrench[1,6];
        real WheelTwist[6];

equations

        // copy all values from the AbsH matrix
        // but by subtracting the g_radius from the z-coordinate

        // the rotation part
        // now unity, so no rotation w.r.t. inertial frame
        LowestPointAbsH[1:3,1:3] = eye(3);

        // the position part
        LowestPointAbsH[1,4] = AbsH[1,4];                    // x-position
        LowestPointAbsH[2,4] = AbsH[2,4];                    // y-position
        LowestPointAbsH[3,4] = AbsH[3,4] - g_radius;         // z-position

        // and the last row, which is [0, 0, 0, 1];
        LowestPointAbsH[4,1:4] = AbsH[4,1:4];

        // and set the output port
        zLowestPosition = LowestPointAbsH[3,4];

        // make an adjoint matrix, so we can transform a force
        // acting on the lowest point, to the center of the body
        AbsHinverse = inverseH (LowestPointAbsH);
        invAdjointH = Adjoint (AbsHinverse);

        // make a 1x6 vector holding the translational forces
        WheelWrench = [0.0, 0.0, 0.0, ForceX.F, ForceY.F, ForceZ.F];

        // transform the incoming WheelContactForce vector
        WheelContactForce.F =  transpose (WheelWrench * invAdjointH);

        // and do the same for the twist (velocity) vector
        WheelTwist = invAdjointH * WheelContactForce.v;

        // and pass the velocity
        ForceX.v = WheelTwist[4];
        ForceY.v = WheelTwist[5];
        ForceZ.v = WheelTwist[6];
```

Describing the ground contact

At the three separate ports **ForceX**, **ForceY** and **ForceZ**, we're going to connect the ground contact and the friction in x and y-direction.

47. From the Translation library, choose the ***FixedWorld***, **Damper**, and **SpringDamper** sub-models.

48. Rename the *Damper* and *SpringDamper* to **FrictionX**, **GroundContactZ**.
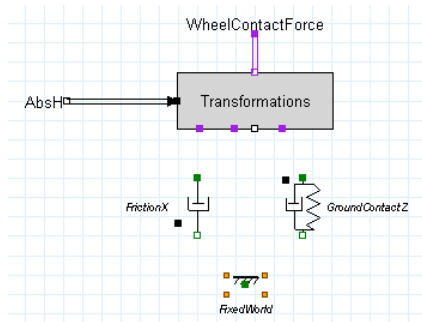

49. Now open the interface of the *FrictionX* model, and add a port name *zPositionLowestPoint*.

50. Do the same with the *GroundContactZ* model.

51. Now go down in the FrictionX model and change the line at the equations like this

```
equations
        p.F = if zPositionLowestPoint < 0 then
                        d * p.v
                else
                        0.0
                end;
```

This means that the friction only is active if the lowest part of the wheel is lower that the ground.

52. For the *GroundContactZ* model rewrite the equations to be like this

```
equations
        p.F = if zPositionLowestPoint < 0 then
                        k * zPositionLowestPoint + d*p.v
                else
                        0.0
                end;
```

This means there is a spring/damper combination active only when the wheel goes through the ground.
We will determine them later when we make a simulation.

Connecting the sub-models

It is now time to connect the sub-models.

53. First copy *FrictionX* and paste it to the model *FrictionY*. They will be both the same.

54. Now connect *FrictionX*, *FrictionY* and *GroundContactZ* to the *Transformations* sub-model at the top. Some small nodes will be inserted, because of the port orientation. Also connect the bottom of the models to the *FixedWorld* and the *zLowestPosition* to all three models.
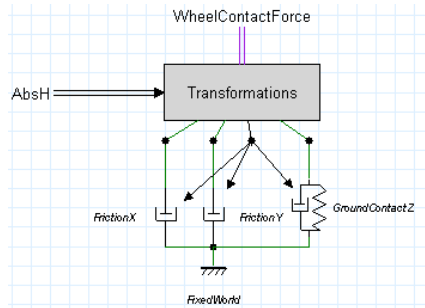

55. Now go up one level, so you see the *TwoWheelRobot3D* model again.

56. Copy the *LeftWheelContact* model, and paste this model, and rename it to **RightWheelContact**.

57. Connect it to the *TwoWheelRobot3D* model, in the same way you connected the *LeftWheelContact* model.

Note: The global parameter *g_radius* is defined twice since we copied the implementation of the *LeftWheelContact* to the *RightWheelContact*. Therefore, remove the value of the parameter at one of the sub-models.
Simulating the model

Before simulating the model, the parameters should be set properly.

58. Open the parameters editor and select the sub-model **LeftWheelContact \GroundContactZ** and change the parameters to:

    d = 1k {N.s/m}
    k = 100k {N/m}

59. Do the same with the **RightWheelContact\GroundContactZ.**

60. Open the *Parameters Editor* again, and change the **ConstantLeft** and **ConstantRight** models the values to **C = 0.01**

61. Change the friction in X -and Y-direction of both left wheel as right wheel to **d = 10 {k.N.s/m}**

The contact model should now be working as expected. However, the car is rotating. This is because the wheels are actuated with a constant torque. The torque is applied between the wheels and the body, so they will rotate in opposite directions.

Step 6: Balancing the mass

We want to be able to control two things:

The mass of the robot should remain upright.
The mass of the robot should be under a certain angle such that it moves with a constant velocity.

Because we rotate over the y-axis a positive rotation will tilt the mass in the forward x-direction. In order to do this, we must move the robot forward to balance this mass. So by controlling the angle, we control the velocity of the vehicle.

Measuring the angle of the robot

62. Go to the 3D Mechanics model and from Sensors in the library choose **RotationMatrix(3x3)**
63. Rename it to **Rbody** and connect it to the *CarBody* at the location of the axis: [0, 0, -0.025].

Generate 20-sim code again. An additional port is now available holding the Rotation matrix of the CarBody.

From this rotation matrix we can extract the tilting-angle.

64. In 20-sim create a new sub-model with the name *CarAngle*. At the interface define two ports:

- input: signal R[3,3]
- output signal angle

For the implementation fill in the following:

```
variables
      real angles[3];
equations
      angles = dll('EulerAngles.dll', 'EulZYXrFromRotationMatrix', R);
      angle = angles[2];
```

What this does is, it gives the three angle rotations that are applied next to each other in the order: Z-axis rotation, Y-axis rotation and X-axis rotation.

If we're moving in the x-direction, the rotation of the x-axis and z-axis are zero, so this will only have value for the y-axis.
If we drive in a circle, we first have to rotate over the z-axis, and then the y-axis. The x-axis will remain zero in that case as well.

Now connect the complete model in the following way:
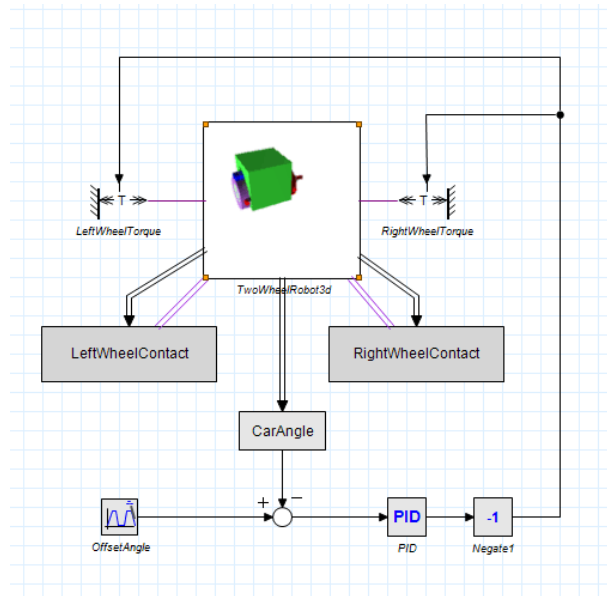

What we see here is that the angle of the car is compared to a reference angle. The difference is fed into a PID controller. The output of the controller is given to both wheel motors.

There is an additional multiplication of -1, because a positive torque on the wheels, will make the wheel move backward (positive angle is counter-clockwise). We want it to move forward with a positive measured angle.

The OffsetAngle can be created by a simple MotionProfile submodel. Choose the amplitude not larger than 0.5 {rad}. You can give any type of movement you want. The PID works fine with the default parameters. Simulating the model should drive the car in a straight line.

10 Animation Toolbox

10.1 Animation Toolbox

Animation is a powerful method to inspect and verify your simulation results, especially when working in three dimensions. The 20-sim *Animation Toolbox* offers you an easy way to create 3D Animations and view graph animations.

3D Animation

Simulation results in 20-sim can be shown as animations using a *3D Animation Editor*. Animations are composed of predefined objects like cubes, spheres, lines, squares, cameras and lights. Complex objects can be imported from CAD packages using common exchange formats.

Objects

Any variable of a 20-sim model can be connected to an object. Various attributes of the object can be controlled this way: position, orientation, size, etc. Thermal graphs can be created by controlling the color of the objects.
In the 3D Animation Editor you can connect every object property to a variable in the model.

Reference frame objects can be used to group animation objects and inherit object attributes. Objects can be duplicated, resulting in complex animation with a few mouse clicks.

Connected to Simulation

Animations are fully linked to the 20-sim *Simulator*. While a plot is being drawn, simultaneously the animation will be shown! This link is kept after a simulation has finished. While inspecting the numerical values, you will notice that the 3D Animation changes simultaneously!

Movies

Every animation can be exported to movies in various formats (mpg, wmv, avi. flash) for the use in presentations and external programs.

Graph Animation

With 20-sim Graph Animation you can display the results of a simulation in your graphical model. During simulation, the thickness and color of the bonds, connections and signals will correspond with the values they carry.

10.2 3D Animation Basics

This lesson demonstrates how to build a simple 3D-animation. It helps you to understand the basics of reference frames, define objects and couple them to variables in your model.

Model

1. **Open** 20-sim and **load** the model *3DAnimation* from the *Getting Started\Animation Toolbox* section of the library.

This model consists of three signal generators. We will use the outputs of these generators to show moving objects in a 3D Animation window.

2. Open the *Simulator*.

3. In the tree at the left select **Window1**. From the **right mouse menu** select **Add Plot** - **3D Animation**.

This will open a *3D Animation plot* next to the standard plot:
The 3D Animation window at start-up.

The first time the 3D Animation window is opened, the **top reference frame** is shown (red = x, green = y, blue = z) in a semi transparent grid (the checkerboard) that covers the xy-plane. All objects you want to show in the 3D Animation window, must be defined with respect to this frame.

4. In the tree at the left select **3D Animation**. From the **right mouse menu** select **Plot Properties**.

This opens the *3D Animation Properties window*:
The 3D Animation Properties window at start-up.

At the left of the *3D Animation Properties window* an object tree is shown with several reference frames and objects:

- Reference Frame: This is the top reference frame. All other reference frames and objects are defined with respect to this frame.

- Default Lights and Cameras: This reference frame contains the default lights and cameras.

- Scenery: In this reference frame you can add your own objects.

5. **Close** the *3D Animation Properties* and re-open it by **double clicking** in the 3D Animation plot.

Cameras

The 3D Animation window comes with five default cameras. All cameras are defined with respect to the *Default Lights and Cameras* frame, which has the same orientation as the top reference frame.

Front Cameras

There are three cameras which are positioned on top of the principal axes of the *Default Lights and Cameras* frame. The front cameras do not show in perspective.

6. In the **3D Properties** window, from the objects tree select the **Front(XY)-Camera**.

As you will notice the view in the 3D Animation window changes. It shows the x-axis (red) and y-axis (green) of the top reference frame:
The view with the Front (XY) Camera selected.

7.   Try out the other cameras.

Camera Looking at Origin

The *Camera Looking at Origin* can be positioned at every desired place but will always look at the origin of the *Default Lights and Cameras* frame.

8.   In the *3D Animation Properties window*, from the objects tree select the **Camera Looking At Origin** and inspect the *position tab* on the right of the window.

9.   Change the Y-position of the **Camera Looking At Origin** and inspect the results in the 3D Animation window.

As you will see the position of the camera can be changed, but its orientation will always be chosen to make the camera look at the origin of the *Default Lights and Cameras* frame.
Position and orientation of the Camera Looking at Origin.

Adding Objects

With the camera in a good position, it is easy to add objects. We will remove the *3D Animation window* and open it again to get a fresh set of cameras.

10. Close the **3D Properties** and the **3D Animation window**.

11. In the tree at the left select **3D Animation**. From the **right mouse menu** select **Delete Plot**.

12. In the tree at the left select **Window1**. From the **right mouse menu** select **Add Plot** - **3D Animation**.

13. Open the **3D Properties** window.

12. In the **3D Properties window**, from the objects tree select the **Scenery** frame.

13. From the right mouse menu select **Edit**, **Insert Object** and **Sphere**.

Now a sphere is added to the objects tree. A dialog is popped-up showing the ***Object Properties*** of the *Sphere*.

14. Change the properties of the Sphere into:

Color	**Scaling Values**
Red, Value = 1.0	Scale X, Value = = 0.5
Green, Value= 0.0	Scale Y, Value = = 0.5
Blue, Value = 0.0	Scale Z, Value = = 0.5

15. **Close** the *Object Properties* dialog and set the position and orientation of the sphere equal to:

Position	**Orientation (Bryant)**
X-position, Variable = *Sine \output*	X, Value = 0.0
Y-position, Value = 0.0	Y, Value = 0.0
Z-position, Value = 0.0	Z, Value = 0.0

16. For the X-position you have to choose the correct *variable* using the **Choose Variable** button.

Your *3D Properties window* should now look like:
The X-position of the sphere is coupled to a variable of the 20-sim model.

17. **Close** the *3D Properties window* and return to the 20-sim *Simulator*.

18. From the **Simulation** menu select **Run** to calculate the plot (or click the blue *Run Simulation* button ▶).

19. From the **Simulation** menu select **Replay** and **3D Animation** (or click the green *Run 3D Animation* button ▶) and you will see the *Sphere* move.
The sphere moving along the X-axis.

If you have problems producing a good animation, close all windows. Open 20-sim and **load** the model *3DAnimation1* from the *Getting Started\Animation Toolbox* section of the library. This model will show the proper animation of the moving sphere.

Zooming

The object is quite far away. We will use the camera zoom to get a close look.

20. Open the **3D Properties** window and from the objects tree select the **Default Lights and Cameras** and **Camera Looking at Origin**.

21. Select the **Object Properties** (tab at the right) and click the **Set Object Properties** button.

22. Pull the **Zooming slider** until you have a closer look at the object and close the Properties window.
Use the Camera properties to change the zooming level.

Other Objects

23. In the tree at the left of the 3D Properties window select the **Scenery** frame.

24. From the menu select **Edit**, **Insert Object** and **Cube**.

25. Open the 3D Properties window and from the objects tree select the **Scenery** frame.

26. From the menu select **Edit**, **Insert Object** and **Cube**.

We would like to see the *Cube* rotate.

27. Select the *Cube* from the objects tree and change the ***Object Properties*** to:

Color	Scaling Values	Position	Orientation (Bryant)
Red = 0.0	X = 0.5	X-position = 0.0	X = 0.0
Green = 1.0	Y = 0.5	Y-position = 2.0	Y = 0.0
Blue = 0.0	Z = 0.5	Z-position = -0.25	Z = *Triangle\output*

28. Like the *Cube* now **add** a ***Line*** object.

We want the line to rotate along the Y-axis.

29. Select the ***Object Properties*** of the ***Line*** and change the properties to:

Color	Start Position	End Position
Red = 1.0	X-position = 0.0	X = *Sine\output*
Green = 1.0	Y-position = 1.0	Y = 1.0
Blue = 1.0	Z-position = 0.0	Z = *Cosine\output*

30. **Close** the ***3D Properties window*** and return to the 20-sim ***Simulator***.

31. From the **Simulation** menu select **Run** to calculate the plot (or click the blue *Run Simulation* button ▶).

32. From the **Simulation** menu select **Replay** and **3D Animation** (or click the green *Run 3D Animation* button ▶).

You will see the sphere move, the cube rotate and the line rotate along the Y-axis. It should look like the figure below:
Three moving objects.

If you have problems producing a good animation, close all windows. Open 20-sim and **load** the model *3DAnimation2* from the *Getting Started\Animation Toolbox* section of the library. This model will show the proper animation of the moving objects.

10.3 Planetary System

All objects in a 3D Animation can be defined with respect to the **top reference frame**. If you have multiple objects that move relative to the top reference frame but have a fixed position and orientation to with respect to each other, it is useful to introduce additional reference frames. We will demonstrate this by creating a 3D Animation of a planetary system.

Remove Default Elements

1. **Open** 20-sim and **load** the model **Planetary System** from the *Getting Started \Animation Toolbox* section of the library.

2. Open the *Simulator*.

3. In the tree at the left select **Window1**.

4. From the **right mouse menu** select **Add Plot** - **3D Animation**.

5. In the tree at the left select **3D Animation**. From the right mouse menu select **Plot Properties**.

Change background and remove the grid

We will remove the grid and change the background.

6. From the **Properties Menu** select **General Properties**.

7. Select the **Choose Color** button and **change the background color to black**.

8. **De-select** the **Apply Image** check box and the **Show Grid** check box.
In the General Properties window you can select the background color and the grid.

9. **Close** the **General 3D Properties window.**

Sun

10. Select the **Scenery *Reference Frame*** and rename it (**Edit** menu) to: ***Sun Reference Frame***.

11. Select the ***Sun Reference Frame.***

12. Insert a **Spot Light**.

13. **Rename** it to ***Sun Light*** and change the **properties** to:

Ambient Color	Diffuse Color	Specular Color	Position
Off	On	On	
Red = 0.0	Red = 1.0	Red = 1.0	X-position = 0.0
Green = 0.0	Green = 1.0	Green = 1.0	Y-position = 0.0
Blue = 0.0	Blue = 1.0	Blue = 1.0	Z-position = 0.0

14. **Select** the ***Sun Reference Frame*** and insert an **Ambient Light**. Change its **properties** to:

Ambient Color	Diffuse Color	Specular Color	Position
On	Off	Off	
Red = 0.5	Red = 0	Red = 0	X-position = 0.0
Green = 0.5	Green = 0	Green = 0	Y-position = 0.0
Blue = 0.5	Blue = 0	Blue = 0	Z-position = 0.0

15. **Select** the ***Sun Reference Frame*** and insert a **Camera**. Change the **zooming** until you have a good view.

Now your 3D Animation should look like:
With an additional camera you will have a new view.

16. **Select** the ***Sun Reference Frame*** and insert a **Sphere**.

17. **Rename** it to ***Sun*** and change the **properties** to:

Color	Scaling Values	Position	Orientation (Bryant)
Red = 1.0	X = 1.0	X-position = 0.0	X = 0.0
Green = 1.0	Y = 1.0	Y-position = 0.0	Y = 0.0
Blue = 0.0	Z = 1.0	Z-position = 0.0	Z = 0.0

18. **Select** the ***Sun Reference Frame*** and insert a **Circle**.

19. **Rename** it to ***Hot Spot*** and change the **properties** to:

Color	Scaling Values	Position	Orientation (Bryant)
Red = 0.0	X = 0.2	X-position = 0.5	X = 0.0
Green = 0.0	Y = 0.2	Y-position = 0.0	Y = 1.57
Blue = 0.0	Z = 0.2	Z-position = 0.0	Z = 0.0

Earth

As you might have guessed we are creating the sun. For the earth motion we will use a second reference frame.

20. **Select** the ***Sun Reference Frame*** and from the **Edit** menu select **Copy** and **Paste**.

As you can see a second reference frame is added including objects.

21. From the second reference frame delete the **Sun Light** and **Camera** objects.

22. Click on the **Camera** of the **Sun Reference Frame** to get a correct view again.

23. **Rename** the second reference frame to ***Earth Reference Frame*** and change the properties to:

Scaling Values	Position	Orientation (Bryant)
X = 0.3	X-position = *Sine\output*	X = 0.0
Y = 0.3	Y-position = *Cosine\output*	Y = 0.0
Z = 0.3	Z-position = 0.0	Z = *Sine\arg*

24. From the *Earth Reference Frame* **select** the **Hot Spot** object and change the **name** to ***Launch Site***.

25. **Select** the **Sun** object and change its name to ***Earth***.

26. Change its color to red = 0, green = 0.5 and blue = 1.

27. Select the ***Camera*** from the ***Sun Reference Frame***.

We have added objects and variables which haven't been simulated before. To see a good animation, we first have to run a simulation.

28. **Close** the ***3D Animation Properties window*** and return to the 20-sim ***Simulator***.

29. From the **Simulation** menu select **Run** to calculate the plot (or click the blue *Run Simulation* button ▶).

30. From the **Simulation** menu select **Replay** and **3D Animation** (or click the green *Run 3D Animation* button ▶).

Now you will see the earth orbiting the sun. It should look like the figure below:
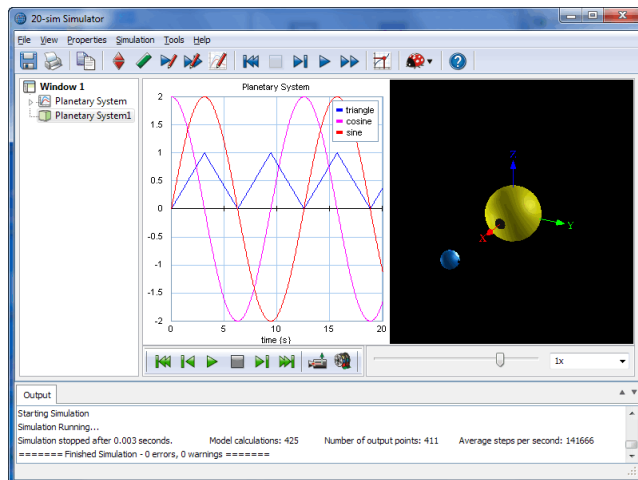

The earth orbiting the sun.

If your objects seem far away, change the zooming of the camera.

Moon

The same trick as we did with the earth will now be repeated to create a moon.

31. Open the ***3D Properties window***.

32. Select the **Earth Reference Frame** and from the **Edit** menu select **Copy** and **Paste**.

33. **Rename** the objects to *Moon Reference Frame*, *Moon* and *Lunar Landing Site*.

34. Select the *Moon Reference Frame* and change the **properties** to:

Scaling Values	Position			Orientation (Bryant)
X = 0.5	X-position	=	*Cosine* \output	X = 0.0
Y = 0.5	Y-position	=	*Sine* \output	Y = 0.0
Z = 0.5	Z-position = 0.0			Z = *Sine\arg*

35. Select the *Moon* and change its color to red = 1, green = 1 and blue = 0.5.

36. **Select** every reference frame and de-select the option **Show Frame**.

You can also press the **Ctrl-key** and de-select the *Show Frame* option of the top frame. This will make that all underlying frames will have the *Show Frame* option de-selected.

37. Select the *Camera* from the **Sun Reference Frame**.

Viewing the Animation

38. **Close** the *3D Properties window* and return to the 20-sim *Simulator*.

39. From the **Simulation** menu select **Replay** and **3D Animation** (or click the green *Run 3D Animation* button ▶).

Now you should see the earth orbiting the sun:
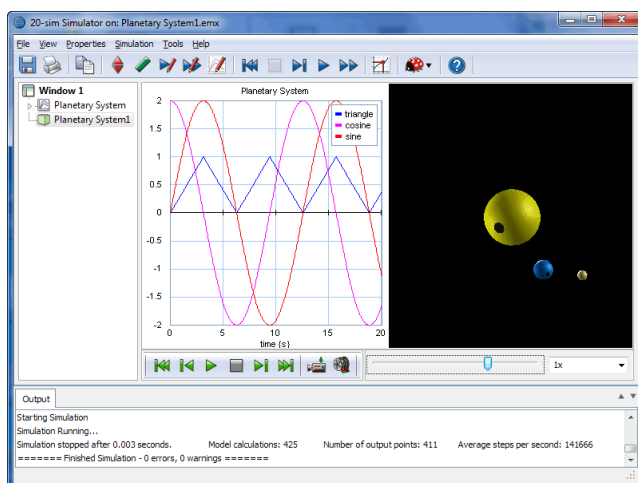

The earth orbiting the sun and the moon orbiting the earth.

40. In the *Simulator,* from the **View** menu select **Numerical Values**.

With the *Numerical Values window* you can inspect the values of the simulation plot. At the same time you will see the corresponding view in the *3D Animation window*. If you use the slider of the *Numerical Values window* you can seen the earth and the moon move.

41. Use the slider of the *Numerical Values window* to move the *earth* and the moon.

Switching Cameras

42. In the ***3D Properties window*** select the **Earth Reference Frame** and insert a **Camera** object. Change the **zooming** until you have a good view.

43. **Change** the name of the Camera into ***Earth Camera.***

44. In the 3D Animation window click the **Play** ▶ button to see the sun and moon moving around the earth.

45. Switch between cameras by clicking the **Camera** button.

46. If you have problems producing a good animation, close all windows. Open 20-sim and **load** the model *Planetary System1* from the *Getting Started\Animation Toolbox* section of the library. This model will show the proper animation of the planetary system.

11 Control Toolbox

11.1 Control Toolbox

The Control Toolbox of 20-sim contains several tools that can aid you in developing controllers for your modeled machines, the *Controller Design Editor*, the *Filter Editor* and the *Neural Network Editors*.

Controller Design Editor

1. In the Editor from the **Tools** menu select **Control Toolbox** - **Controller Design Editor**.

The *Controller Design Editor* is a specialized tool for the design of feedback control systems. A feedback structure of subsystems is presented with a linear plant, controller, measurement and pre-filter. Also the open-loop and closed-loop gains and the sensitivities are available.
The Controller Design Editor.

You can edit your controller as an ABCD State Space system, a Transfer Function or in a Zero Pole Gain form. Changes in one of the subsystems directly update all open plots and dialogs. For instance, adapting the controller gain immediately changes poles and zeros of the closed-loop system and the overall step response. The integration within 20-sim and linear system exchange with MATLAB makes this editor a powerful tool for designing feedback control systems!

Filter Editor

2. In the Editor from the **Tools** menu select **Control Toolbox** - **Filter Editor**.

With the *Filter Editor* you can create your own linear filters according to your specifications. Available filters are Bessel, Butterworth and ChebyChev filters where you can specify the order and characteristic frequencies. A choice can also be made from PID, lead/lag, or notch filters.
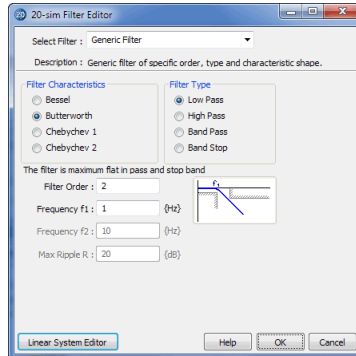

The Filter Editor.

Neural Network Editors

3. In the Editor from the **Tools** menu select **Control Toolbox** - **B-Spline Network Editor**.

The 20-sim Control toolbox supports two well-known networks: Adaptive B-Spline Networks and Multi-Layer Perceptron Networks.
The B-Spline Editor.

These neural networks must be trained by repeatedly presenting examples to the network. Each example includes both inputs and desired outputs. Based on the error between desired outputs and the real network output, the neural network adapts the weight of each neuron according to a user-defined learning rate. If the response is accurate enough, you can save the weights of the neurons, to use the neural network in your controller. An unlimited number of neurons may be used.

12   Frequency Domain Toolbox

12.1 Frequency Domain Toolbox

The 20-sim *Frequency Domain Toolbox* consists of the *Linear System Editor*, *FFT Analysis, Model Linearization* and *Dynamic Error Budgeting* functionality.

Linear System Editor

The *Linear System Editor* is a specialized tool for the design and analysis of linear systems. The editor supports continuous-time and discrete-time SISO systems using various representations.

The graphical interface allows you to edit a linear system in any desired form: ABCD state space, Transfer Function or Zero Pole Gain. Analyzing the Step response, Bode plot, Nyquist diagram, Nichols chart and Pole-Zero plots allows you to quickly evaluate system behavior. Phase, gain and modulus margins are calculated, as well as rise time, overshoot and steady state value.

Input can originate from a 20-sim linear system model, 20-sim filter or control editor, MATLAB workspace, or user input. You are able to generate output for all 20-sim editors, the clipboard and the MATLAB workspace.

Fast Fourier Transform

Fast Fourier Transforms (FFT) can be applied to any time-domain plot in 20-sim. Either simulation results or measurement data will do. When the data is not equally spaced, linear interpolation is first applied after which the Fast Fourier Transform is used to calculate the frequency contents. Three representations are supported: Amplitude and Phase plot, Frequency plot and Power Spectral Density plot.

Model Linearization

Any 20-sim model can be linearized to state space form. If possible, linearization will be performed symbolically. Otherwise linearization will be performed numerically.

The resulting state space model is shown in the 20-sim *Linear System Editor*. The *Linear System Editor* is a specialized tool for the design and analysis of linear systems. The editor supports continuous-time and discrete-time SISO systems using various representations. Standardized plots enable you to quickly evaluate system behavior.
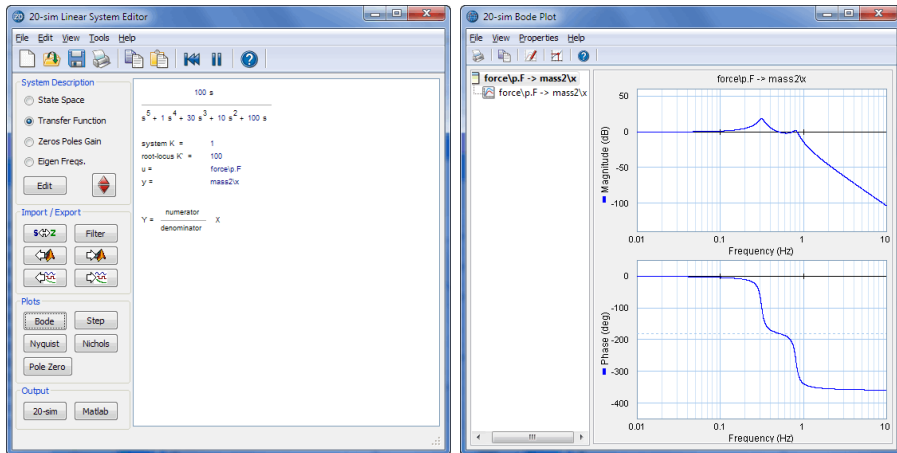

In the Linear System Editor you can generate bode plots.

Features

- Editing as ABCD state space, Transfer Function or Zero Pole Gain with automatic transformation between these forms.
- Transfer between continuous-time and discrete-time representation.
- View characteristic properties like eigenfrequencies and damping.
- Handles numeric and symbolic models.
- Various plot options: Step Response, Bode Plot, Nyquist Diagram, Nichols Chart and Pole-Zero Plot.

Dynamic Error Budgeting

The performance of precision machines is mostly limited by the disturbances that are injected in these machines. These disturbances are often stochastic in nature. Dynamic Error Budgeting is a method whereby the effect of these disturbances on the final performance can be calculated. The advantage of this method is that it enables the designer to enter the contributions of the individual disturbances and view and optimize the overall machine performance.
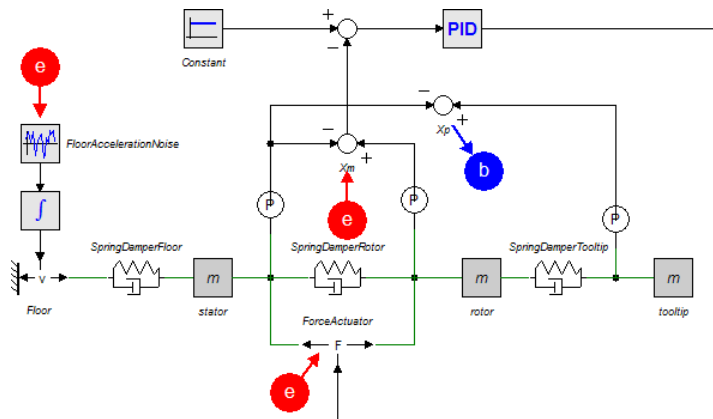

The Dynamic Error Budgeting toolbox shows the total error as a result of injected disturbances.

Running the Toolbox

You can open the Dynamic Error Budgeting tool in the *Simulator*:

1. **Open** 20-sim and **load** the model *Dynamic Error Budgeting* from the *Getting Started \Frequency Domain Toolbox* section of the library.

2. In the *Simulator* from the **Tools** menu select **Frequency Domain Toolbox** and **Dynamic Error Budgeting**.
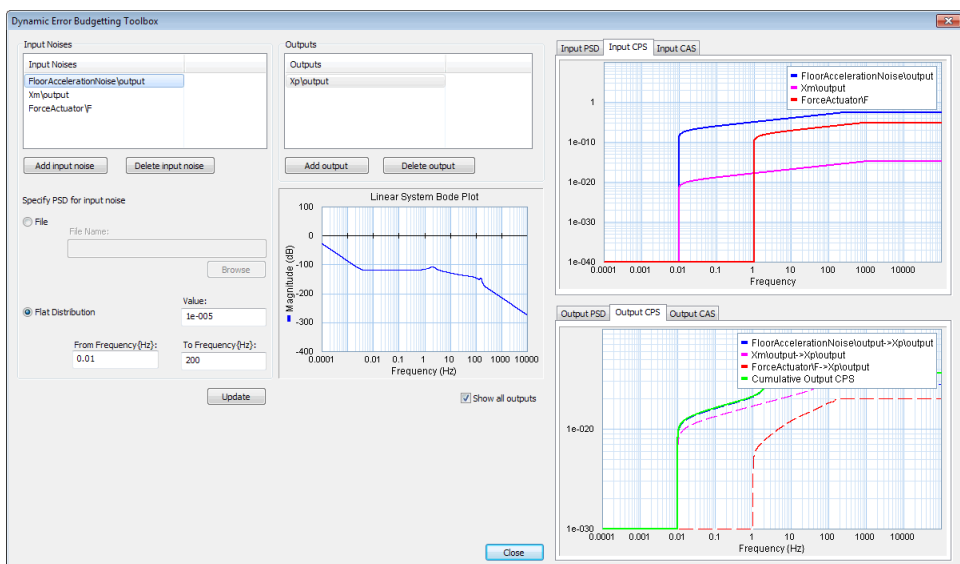

The Dynamic Error Budgeting tool.

The tool allows you to enter disturbances (as power spectral density) in the *Input Noises* section.

3. For each disturbance you have to select a corresponding variable by clicking the **Add input noise** button.

Each disturbance is effectively a summation to the chosen variable, just like closed loop linearization. You can inspect each disturbance in the graph on the top right.

Next you have to select an output variable, where the result of the disturbances is calculated.

4. Select the output by clicking the **Add Output** button.

In the graph on the bottom right you can see the resulting error at the selected output as a result of the disturbances. The error is given in the form of a power spectral density (PSD) and cumulative power spectral density (CPS). The square root of the final value of the CPS is equal to the standard deviation of the output error.

13   Mechatronics Toolbox

13.1 Mechatronics Toolbox

The *Mechatronics Toolbox* includes the following items:

1.   CAM Wizard

2.   Motion Profile Wizard

3.   Servo Motor Editor

13.2 Cam Wizard

How to use the Cam Wizard

Introduction

Cams and mechanisms are all based on the same principle. The motion of an input axis is transformed to an output axis or translation. The transformation is a function of the input angle. This function is called the **cam motion profile**.
The 20-sim cam wizard helps you to generate cam and mechanism models. You can use various types of motion profiles which are continuous in velocity, acceleration or even in jerk! An example of a mechanism that can be generated by the Cam wizard is the crank-rod mechanism, where a rotary input motion is transformed to a translating output motion.
The models that are generated by the 20-sim Cam wizard are fully dynamic! This means:

* The models describe the output velocity as function of the input velocity but also the input torque as function of the output load.

* The speed of the input axis does not have to be constant nor does the output load.

- No inertia, stiffness or other dynamic behavior is included, but this can be easily incorporated by coupling elements from the 20-sim library (inertias, springs etc.) to the input or output of the model.

Example

To generate a cam or mechanism model in 20-sim, follow the next steps.

1. Open the 20-sim model library an go to the section *Iconic Diagram\Mechanical \Rotation\Gears* and drag the model *Cam-Wizard.emx* to the editor. You can also select in the Editor: *Tools - Mechatronics Toolbox - Cam Wizard*.

2. Select the Cam-Wizard model and click Go Down. Now the wizard will be opened.

3. Choose the desired motion profile, the profile parameters and type of output (translation/rotation):
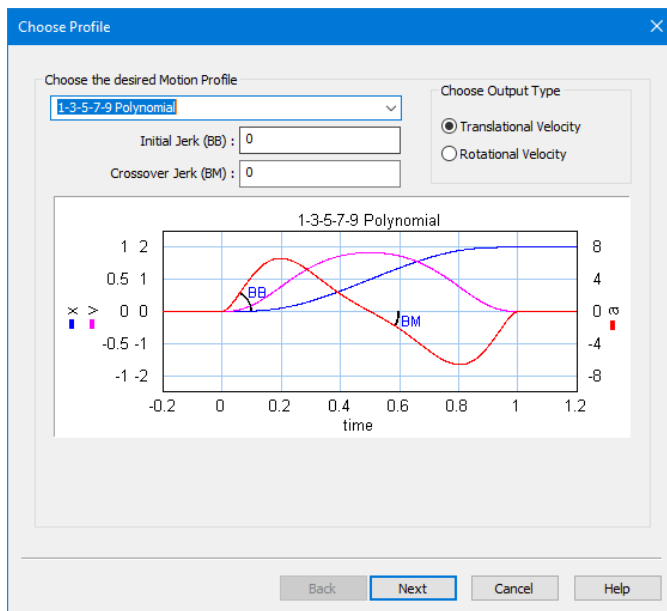

5. Select the type of cam motion profile:
6. Enter the parameters values (Stroke, Start Angle Stop Angle). If you have chosen a continuous pulse as output, you must also enter the values for the Return Angle and End Angle:
7. In the last page, the resulting values are shown:
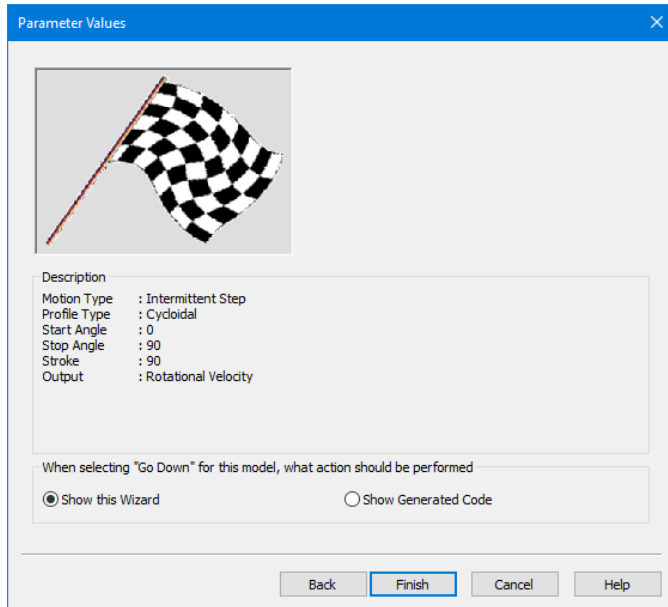

8. Click *Finish* and the cam model will be defined. All you have to do is to connect the input axis (*p_in*, rotation) and the output axis (*p_out*, rotation or translation) of the cam model.

Note

1. If you have changed the settings of this wizard, you have to process the model first (from the *Model* menu, choose *Check Complete Model*) before the changes become effective.

2. You can change parameter values during simulation (from the **Properties** menu select Parameters).

3. This is a masked model that uses the dll-file MotionProfile.dll to open the wizard. This dll-function must be stored in the bin directory of 20-sim. To see the SIDOPS code of a masked model press the *shift-key*, while clicking the *Go Down* command.

Cam Motion Profiles

Motion Types

Two types of motion profiles can be generated by the Cam wizard: **intermittent steps** and **continuous pulses**. The intermittent step motion does not return to its starting position, but gradually moves further away . It is characterized by the parameters stroke, start_angle and stop_angle.
The **continuous pulse** motion output returns at the end of each cycle returns to the starting position. It is characterized by the parameters stroke, *start_angle, stop_angle, return_angle* and *end_angle.*
Motion Profiles

In mechanical engineering an important part of design is the reduction of vibrations. Every time a construction is in motion, vibrations are induced. When cams or mechanisms are used, the amount of vibrations, depend on the kind of motion that is induced. E.g. a sudden step change will induce violent vibrations in comparison with with a fluent motion. An important parameter to characterize motions, is the order:

1. *Zero Order:* Motions that are discontinuous in the position (e.g. a step).

2. *First Order:* Motions that are continuous in the position but discontinuous in the velocity (e.g. a ramp).

3. *Second Order*: Motions that are continuous in the position and velocity but discontinuous in the acceleration.

4. *Third Order*: Motions that are continuous in the position, velocity and acceleration.

5. *Fourth Order:* Motions that are continuous in the position, velocity, acceleration and jerk.

The specific shape of a motion profile can have a significant influence on the dynamic behavior. Some profiles minimize the maximum velocity, some profile minimize acceleration, while other profiles tend to make a tradeoff between the maximum velocity and acceleration. If we take a standard motion with stroke 1 and motion time 1 sec., the following table can be generated:

profile	order	v_{max}	a_{max}	$y(0)$	$y(1/2)$
Ramp	1	1	infinite	infinite	0
Crank-Rod[2]	2	> 1.57	> 4.93	infinite	< -15.5
Trapezoidal	2	2	4	infinite	-infinite
Partial Trapezoidal[1]	2	1.67	4.17	infinite	0
Geneva Mechanism	2	2.41	8.49	infinite	-118.5
Sine	2	1.57	4.93	infinite	-15.5
Cubic	3	2	4	32	-32
Partial Cubic[3]	3	1.67	5.55	55.6	0
Cycloidal	3	2	6.28	39.5	-39.5
Modified Sine	3	1.76	5.53	69.4	-23.2
Modified Trapezoidal	3	2	4.88	61.4	-61.4
MSC50	3	1.26	9.20	173.6	0
MSC%[4]	3	1.37	7.20	113.1	0
3-4-5 Polynomial	3	1.88	5.77	60	-30
1-3-5-7-9 Polynomial[5]	3/4	2.05	10.25	BB	BM

1: Parameter CV = 20%

2: For lw >> lc the Crank Rod profile equals the sine profile, for lw > lc performance deteriorates.

3: Parameter CV = 20%, CA = 20%

4: Parameter n = 30%, alpha = 10%

5: Parameter BB = 30%, BM = 10%

Here $y(0)$ is the initial jerk (derivative of acceleration) and $y(1/2)$ the crossover (halftime) jerk.

Ramp

The ramp profile is a first order profile. It has a constant velocity and acceleration peaks at the start and end of the motion.

Crank Rod Mechanism

A Crank Rod mechanism converts a rotary motion into a repeating translation and
If the rod is much longer than the crank, the resulting motion profile will approach the sine profile. Below the motion profile is shown for half a rotation of the crank (angle from 0 to 180 degrees in 1 sec.).
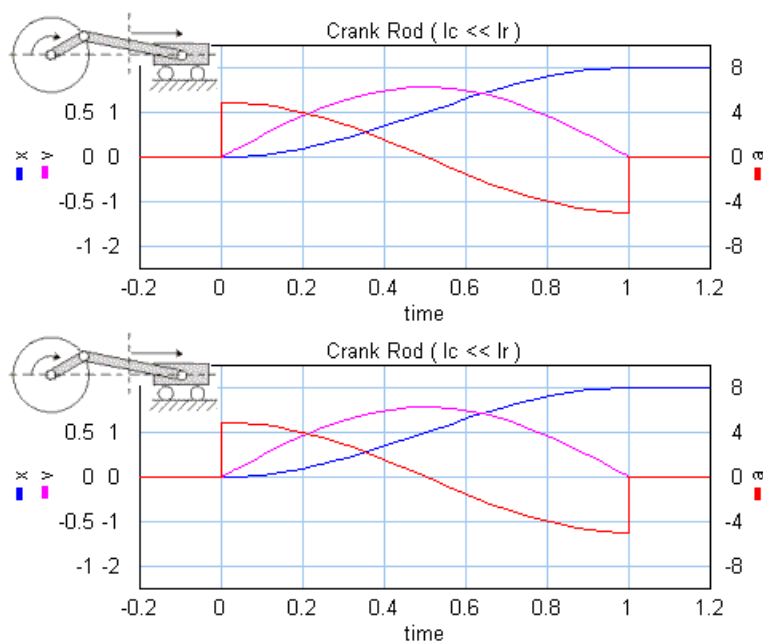

If the rod gets smaller, the maximum velocity and acceleration increase.
Note: A real crank-rod mechanism will not suddenly stop at half a rotation and therefore not show a discontinuous acceleration.

Trapezoidal

The trapezoidal profile is a second order profile. It has a constant acceleration at the start of the motion and a constant deceleration at the end of the motion.

This profile is most widely used in early servo systems. Because of the discontinuity in the acceleration this motion profile can still induce a lot of vibrations. Therefore in modern servo systems third order profiles are preferred.

Partial Trapezoidal

The partial trapezoidal profile is a second order profile. It has is equal to the trapezoidal motion, but has a constant velocity part, during a fraction **CV** (%) of the motion.

Partial Trapezoidal

Geneva Mechanism

A Geneva mechanism is an old motion profile generation mechanism. A continuously rotating crankshaft (a) generates an intermittent motion of a second shaft (b). The result is a second order profile.

The motion profile generator yields the motion of the second shaft (b). It is shown below:
Geneva Mechanism

Sine

The sine profile is a second order profile of which the displacement can be described as:

*x = 0.5 - cos (p * t) / 2.*
Cubic

The cubic profile is a third order profile of which the acceleration is constantly increasing and decreasing.
Partial Cubic

The partial cubic profile (3rd order) is a modified cubic profile with a constant velocity during a fraction **CV** (%) of the motion and a constant acceleration during a fraction **CA** (%) of the motion.
Cycloidal

The cycloidal profile is a third order profile, of which the velocity can be described as:

v = stroke*(1-cos(t*a))
Modified Sine

The modified sine profile is also a third order profile. It is a modification of the cycloidal profile to get a lower maximum velocity and a lower maximum acceleration.
Modified Trapezoidal

The modified trapezoidal profile is a modification of the trapezoidal profile (to make it a third order profile). This profile yields a very low maximum acceleration.
Modified Sine with Constant Velocity (MSC50)

The modified sine with constant velocity profile (3rd order) is a modification of the modified sine profile. It has a constant velocity during 50% of the motion.

General Modified Sine with Constant Velocity (MSC%)

The modified sine with constant velocity profile (3rd order) is a modification of the modified sine profile. It has a constant velocity during a user definable part of the of the motion. The non-zero acceleration part is defined by two parameters which are both defined as a fraction of the motion. The first parameters **alpha** (%) defines the start of the acceleration and the second parameters **n** (%) defines the end of the acceleration.
3-4-5 Polynomial

The is a third profile described by a 5th order polynomial.
1-3-5-7-9 Polynomial

The is a third/fourth order profile described by a 9th order polynomial. The profile is characterized by two parameters that denote the initial jerk, **BB**, and the crossover jerk, **BM**. If BB is chosen zero, this a a fourth order profile. If BB is chosen non-zero, this is a third order profile.
13.3 Motion Profile Wizard

Motion Profile Wizard

The 20-sim Motion Profile Wizard helps you to define motion profiles. To generate such a profile, follow the next steps.

1. Open the 20-sim model library an go to the section Signal\Sources and drag and drop the model MotionProfileWizard.emx to the editor. You can also select in the Editor: *Tools - Mechatronics Toolbox - Motion Profile Wizard*.

2. Select the model and click **Go Down.**

This is a masked model. Clicking Go Down will open the *Motion Profile Wizard.*

4. Select the inputs and outputs:
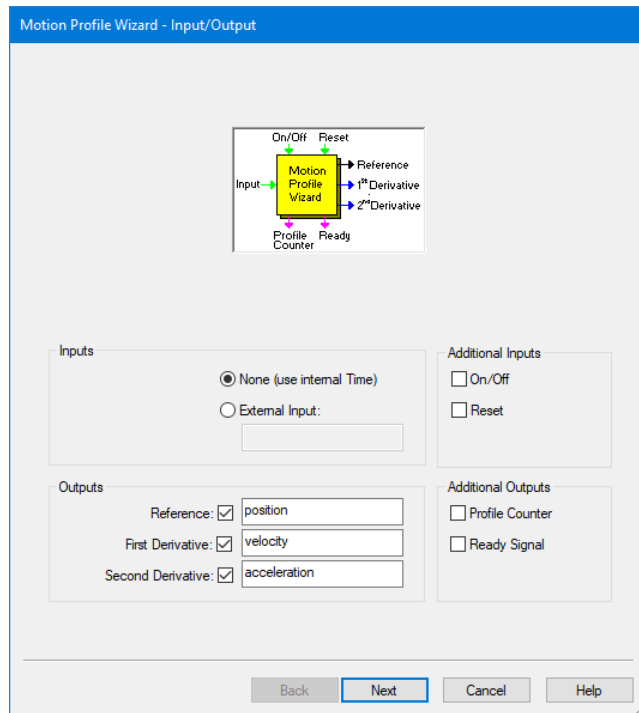

A number of inputs and outputs are available:

- *External Input:* Normally the time will be used for the x-axis of the profile. You can however use an external input as x-axis variable.

- *On/Off*: Use this input signal to start (onoff = TRUE) and stop (onoff = FALSE) the profile.

- *Reset*: When the reset signal gets high (reset = TRUE) the profile will be started.

- *Reference*: The motion profile reference signal, e.g. position.

- First Derivative: The first derivative of the motion profile reference signal, e.g. velocity.

- Second Derivative: The second derivative of the motion profile reference signal, e.g. velocity.

- Profile Counter: Gives the number of profiles that have been generated.

- Ready Signal: Gets high (ready = TRUE) when the profile is completely generated.

5. Click **Next** to enter the desired profile.

6. You can enter as many profiles as needed to design the complete motion. You can choose out of a number of predefined profiles.
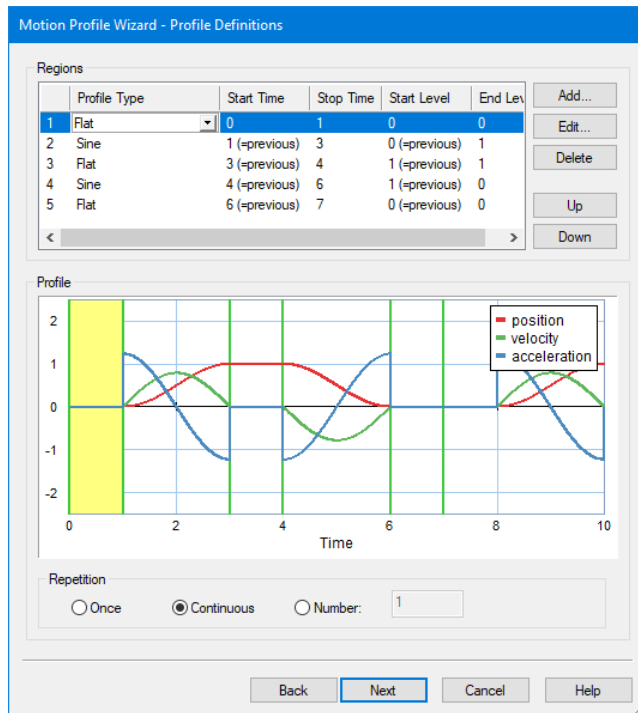

7.   Choose the number of times the motion should be repeated.

8.   Click **Next** to go to the last page.

In the last page, you can choose to generate Time Events and what to show the next time (the wizard or the generated code). Use the default settings if you are not sure what to use.
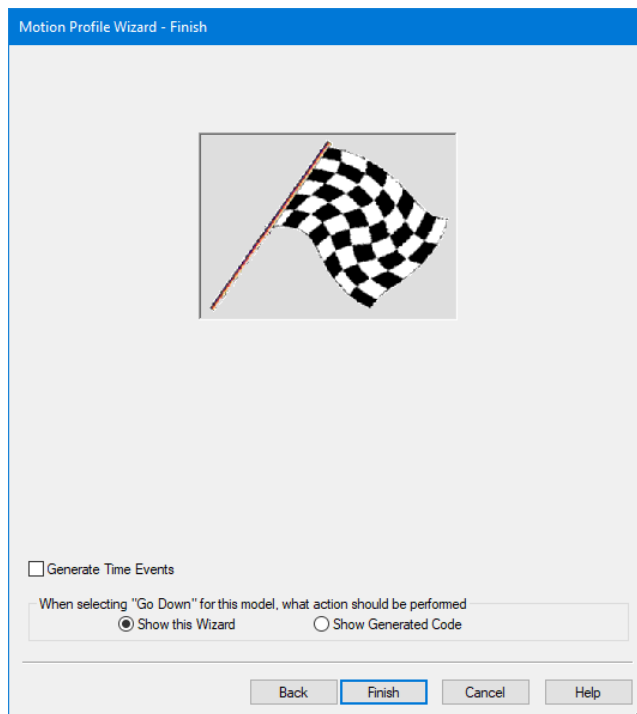

9.   Click **Next** to go to close the Wizard.

10. In the Editor from the **Model** menu Check Complete Model to make the changes effective.

Motion Profiles

You can choose out of a number of predefined motion profiles in the Motion Profile Wizard.

- Flat
- Ramp
- Trapezoidal
- Partial Trapezoidal
- Geneva Mechanism
- Sine
- Cubic
- Partial Cubic
- Cycloidal
- Standard Modified Sine
- Modified Trapezoidal
- Modified Sine with Constant Velocity (MSC50)
- General Modified Sine with Constant Velocity (MSC%)
- 3-4-5 Polynomial
- 1-3-5-7-9 Polynomial

Flat

The flat profile is a zero order profile. It has a constant position, zero velocity and acceleration.

Ramp

The ramp profile is a first order profile. It has a constant velocity and acceleration peaks at the start and end of the motion.
The ramp profile.

Trapezoidal

The trapezoidal profile is a second order profile. It has a constant acceleration at the start of the motion and a constant deceleration at the end of the motion.
The trapezoidal profile.

This profile is most widely used in early servo systems. Because of the discontinuity in the acceleration this motion profile can still induce a lot of vibrations. Therefore in modern servo systems third order profiles are preferred.

Partial Trapezoidal

The partial trapezoidal profile is a second order profile. It has is equal to the trapezoidal motion, but has a constant velocity part, during a fraction **CV** (%) of the motion.
The partial trapezoidal profile.

Geneva Mechanism

A Geneva mechanism is an old motion profile generation mechanism. A continuously rotating crankshaft (a) generates an intermittent motion of a second shaft (b). The result is a second order profile.
A Geneva mechanism.

The motion profile generator yields the motion of the second shaft (b). It is shown below:
The Geneva mechanism profile.

Sine

The sine profile is a second order profile of which the displacement can be described as:

$$x = 0.5 - \cos (p * t) / 2.$$
The sine profile.

Cubic

The cubic profile is a third order profile of which the acceleration is constantly increasing and decreasing.
The cubic profile.

Partial Cubic

The partial cubic profile (3rd order) is a modified cubic profile with a constant velocity during a fraction **CV** (%) of the motion and a constant acceleration during a fraction **CA** (%) of the motion.
The partial cubic profile.

Cycloidal

The cycloidal profile is a third order profile, of which the velocity can be described as:

$$v = stroke*(1-cos(t*a))$$
The cycloidal profile.

Modified Sine

The modified sine profile is also a third order profile. It is a modification of the cycloidal profile to get a lower maximum velocity and a lower maximum acceleration.
The modified sine profile.

Modified Trapezoidal

The modified trapezoidal profile is a modification of the trapezoidal profile (to make it a third order profile). This profile yields a very low maximum acceleration.
The modified trapezoidal profile.

Modified Sine with Constant Velocity (MSC50)

The modified sine with constant velocity profile (3rd order) is a modification of the modified sine profile. It has a constant velocity during 50% of the motion.
The modified sine with constant velocity profile.

General Modified Sine with Constant Velocity (MSC%)

The modified sine with constant velocity profile (3rd order) is a modification of the modified sine profile. It has a constant velocity during a user definable part of the of the motion. The non-zero acceleration part is defined by two parameters which are both defined as a fraction of the motion. The first parameters **alpha** (%) defines the start of the acceleration and the second parameters **n** (%) defines the end of the acceleration.
The general modified sine with constant velocity profile.

3-4-5 Polynomial

The is a third profile described by a 5th order polynomial.
The 1-3-5 polynomial profile.

1-3-5-7-9 Polynomial

The is a third/fourth order profile described by a 9th order polynomial. The profile is characterized by two parameters that denote the initial jerk, **BB,** and the crossover jerk, **BM**. If BB is chosen zero, this a a fourth order profile. If BB is chosen non-zero, this is a third order profile.
The 1-3-5-7-9 polynomial profile.

To keep the polynomial consistent, i.e. the polynomial does not change when the amplitude is changed, the initial jerk (**BB**) and the crossover jerk (**BM**) are defined for a standard motion with:

- *stroke = 1*
- *start_time = 0*
- *stop_time = 1*

Comparison of Profiles

The specific shape of a motion profile can have a significant influence on the dynamic behavior. Some profiles minimize the maximum velocity, some profile minimize acceleration, while other profiles tend to make a tradeoff between the maximum velocity and acceleration. If we take a standard motion with stroke 1 and motion time 1 sec., the following table can be generated:

profile	order	vmax	amax	j(0)	j(1/2)
Flat	0	0	0	0	0
Ramp	1	1	infinite	infinite	0
Trapezoidal	2	2	4	infinite	-infinite
Partial Trapezoidal1	2	1.67	4.17	infinite	0
Geneva Mechanism	2	2.41	8.49	infinite	-118.5
Sine	2	1.57	4.93	infinite	-15.5
Cubic	3	2	4	32	-32
Partial Cubic3	3	1.67	5.55	55.6	0
Cycloidal	3	2	6.28	39.5	-39.5
Modified Sine	3	1.76	5.53	69.4	-23.2
Modified Trapezoidal	3	2	4.88	61.4	-61.4
MSC50	3	1.26	9.20	173.6	0
MSC%4	3	1.37	7.20	113.1	0
3-4-5 Polynomial	3	1.88	5.77	60	-30
1-3-5-7-9 Polynomial5	3/4	2.05	10.25	BB	BM

1: Parameter CV = 20%

2: For lw >> lc the Crank Rod profile equals the sine profile, for lw > lc performance deteriorates.

3: Parameter CV = 20%, CA = 20%

4: Parameter n = 30%, alpha = 10%

5: Parameter BB = 30%, BM = 10%

Here j(0) is the initial jerk yerk (derivative of acceleration) and j(1/2) the crossover (halftime) jerk.

13.4 Servo Motor Editor

Servo Motor Editor

The 20-sim Servo Motor Editor is a program that helps engineers to choose the proper servo motor for any electromechanical system:

- Brush DC (Iron Armature Motor, Hollow Rotor Motor, Disc Armature Motor)
- Brushless DC
- AC synchronous
- AC synchronous linear

In cooperation with motor manufacturers, motor data tables have been created for the *Servo Motor Editor*. The performance of every motor can be shown by the torque speed curve. The *Servo Motor Editor* can generate dynamic models for the simulation program 20-sim. In this program you can simulate the thermal and dynamic behaviour of the servo motor in combination with control loops and dynamic loads.

Any engineer involved in the design of electromechanical machines can benefit from the *Servo Motor Editor*. Precious time and money can be saved by finding the optimal servo motor in a few minutes, without risking overheating or under-powering.
The 20-sim Servo Motor Editor.

Features

- Support of predefined motor data tables.
- Add your own motors to the data table.
- Quick search by multiple parameters.
- Torque-Speed curves with: line of maximum current, maximum torque, maximum voltage, maximum speed, maximum power, maximum efficiency and maximum power output.
- Safe Operating Area, Desired Operating Area.

- Generate dynamic models for the simulation program 20-sim. These models include thermal effects of the coils and housing, electrical losses through dissipation, magnetic losses through hysteresis, eddy currents and cogging.
- Show torque speed curve with dynamic load curve.
- Template models, covering most commercial control schemes and many mechanical loads.

Application Areas

- Control Design
- Industrial Equipment and Machinery
- Precision Engineering
- Simulation
- Utilities and Energy
- Vibration Analysis and Control

How to use the Servo Motor Editor

This section demonstrates how to use the Servo Motor Editor to select the correct motor for a drive train. The Servo Motor Editor is part of the Mechatronics Toolbox. You can use the Servo Motor Editor to create models that include permanent magnet servo motors. In the figure below you see a PID controlled AC synchronous motor driving a load through a gearbox and beltdrive. In this example we will show how to create and use such a model.
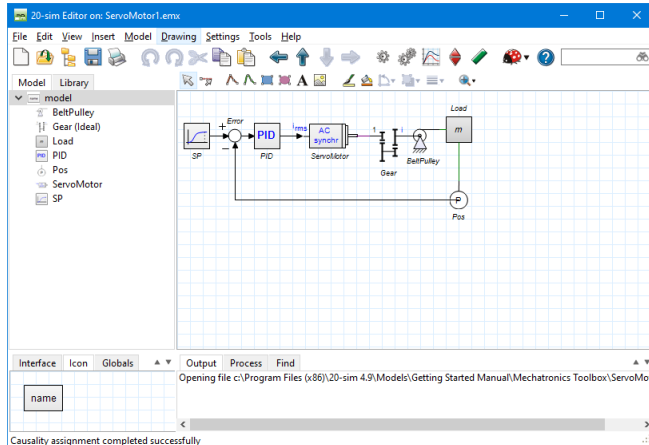

PD controlled servo motor with gearbox and belt.

Model

1. Open 20-sim and select **File**, **New** and **Graphical Model**.

2. From the **Tools** menu select **Mechatronics Toolbox** and **Servo Motor Editor.**

A servo motor model will be inserted:
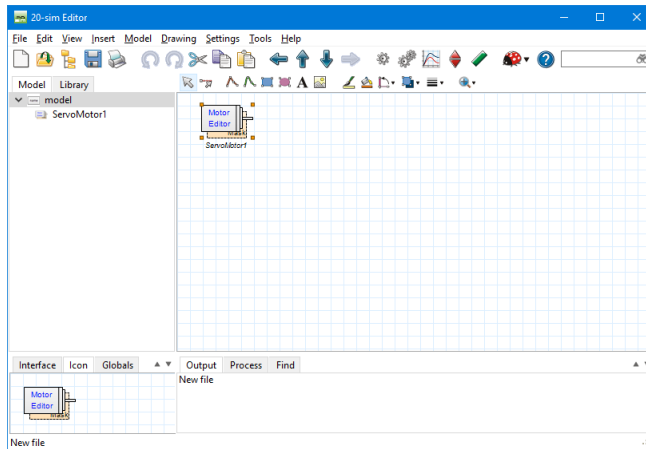

A servo motor inserted.

3. The **Servo Motor Editor** will be opened automatically. If this does not happen, force the editor to open by clicking the **Go Down** button.

The editor will show the default motor list and the parameters of the selected motor.
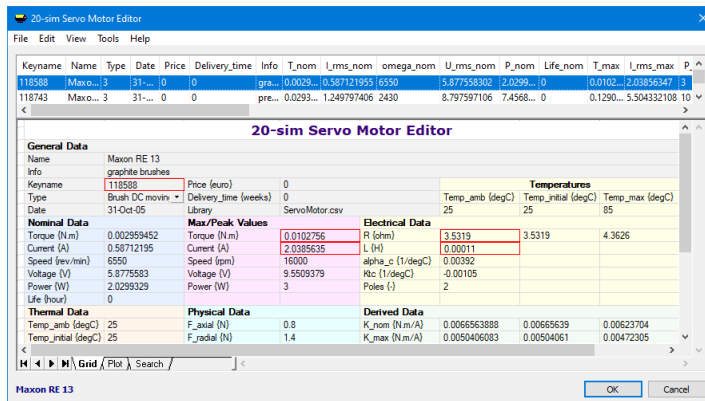

You can choose from a list of existing servo motors in the Servo Motor Editor.

4. From the **File** menu choose **Open Database**.

5. Load the file *ServoMotor.csv*. You can find this file in the folder *C:\Program Files\20-sim 5.0\Tools\Servo Motor Dynamics*

Use *C:\Program Files (x86)\20-sim 5.0\Tools\Servo Motor Dynamics* on 64-bit versions of Windows

Now the Servo Motor Editor will show a list of motors.

6. From the list choose the Maxon EC 60 motor with keyname **167131 s** (almost at the end of the list).

Display the characteristic parameters of a selected motor.

7. Click the **Plot tab** to inspect the torque speed curve.
Show a torque speed plot of the selected motor.

8. Click the **OK** button to close the editor and generate the dynamic model.

The 20-sim editor will now look like:
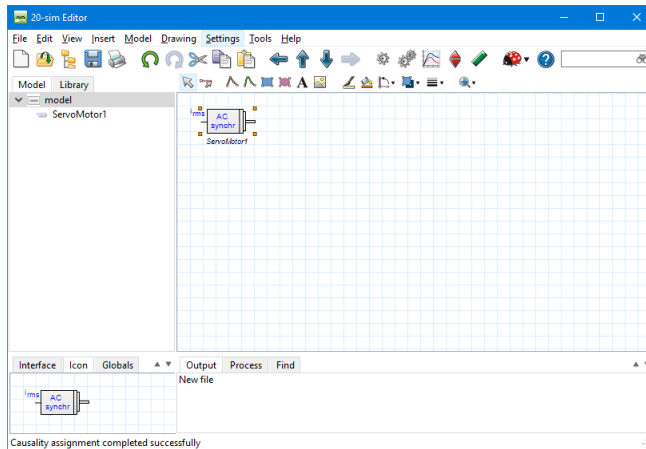

The selected motor is now inserted in 20-sim.

9. **Add** the following models and **connect** them until your model looks like the figure below. Try to give the same **submodel names** as indicated in the figure.

model library	model
Iconic Diagrams\Mechanical\Translation\Sensors	*PositionSensor-Absolute*
Iconic Diagrams\Mechanical\Translation\Components	*Mass (Default)*
Iconic Diagrams\Mechanical\Translation\Transmission	*BeltPulley*
Iconic Diagrams\Mechanical\Rotation\Gears	*Transmission (Ideal)*
Signal\Block Diagram	*PlusMinus*
Signal\Sources	*SignalGenerator-Cycloid*
Signal\Control\PID Control\Continuous	*PID*
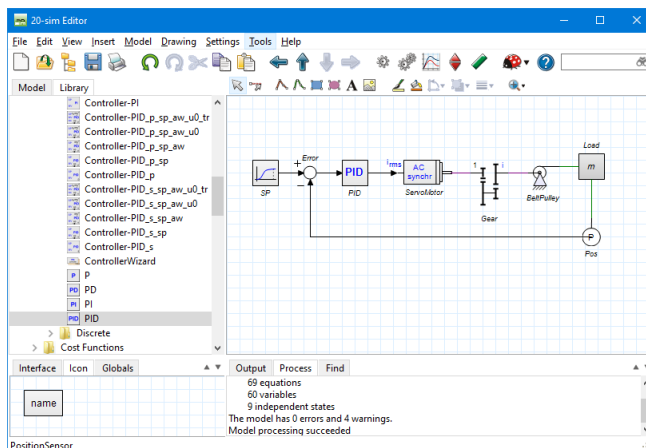

The complete model of the belt driven load.

10. From the **File** menu click **Save as**. Store the model in a temporary directory (e.g. *C:\temp*) using the name *ServoMotor.emx*.

If you have problems creating the model, load the model *ServoMotor1* from the *Getting Started\Mechatonic Toolbox* section of the library.

Simulation

11. In the *Editor* toolbar from the **Model** menu select the **Start Simulator** command.

12. In the Simulator, click the **Parameters** command from the Properties menu.

13. As you will see the parameter values for the AC motor have been filled in automatically by the Servo Motor Editor. **Enter** the other **parameters** as:

Parameter	Value
Load\m	20
PID\kp	5000
PID\tauD	0.05
PID\beta	0.1
PID\tauI	20
BeltPulley\radius	0.1
Gear\i	20
SP\start_time	1
SP\amplitude	1
SP\stop_time	2

14. From the **Properties** menu select the **Run** command and change the default values to:

Start	0
Finish	4
Method	Vode Adams

15. In the tree, select the plot (**model**). From the **right mouse menu**, select **Rename** and rename it to *position*.

16. From the **right mouse menu**, select **Plot Properties**.

17. From the **Properties** menu select the **Plot** command. Add the following plot variables to the **Y-tab**.

Variable	Label
SP\output	SP
Pos\x	x

18. Click on the **Shared Axis** option to select it.

19. **Close** the Plot *Properties Editor* and **run** a Simulation. It should look like the next figure.
Simulation of the drive system.

As you can see the motor is able to drive a load of 20 kg. Now we are going to inspect the thermal behaviour of the motor.

19. In the tree at the left click on ***Window 1*** to select it.

20. From the right mouse menu select **Add Plot** - **Plot**.

Now a second plot will be visible.

20. **Rename** the plot to *temperature*.

21. Open the **Plot Properties Editor** (Properties - Plot). Add the following plot variables to the **Y-tab**.

Variable	**Label**
ServoMotor\Temp_coil	coil
ServoMotor\Temp_housing	housing

22. Click on the **Shared Axis** option to select it.

23. **Run** a new **simulation.** The *Simulator* will look like the next figure.
In the Simulator you can open additional plots.

The coils heat up immediately and the housing heats up gradually. We have to run a simulation for a longer time, to see if the motor will overheat. We can also inspect the torque speed curve to inspect the thermal behaviour.

24. From the **View** menu choose **New Plot Window**. This will open a new plot.

25. Open the **Plot Properties Editor** (Properties - Plot). Add the following plot variables.

x-axis	Variable	Label
	ServoMotor\omega_range	speed

y-axis	Variable	Label
	ServoMotor\T_100	T_100
	ServoMotor\T_25	T_25
	ServoMotor\Torquemax	max torque
	ServoMotor\T_abs	load torque

For the variable *ServoMotor\T_abs* we will choose a separate x-axis.

26. Select the tab with **Load Torque** and then select the **Separate X-Axis** option at the bottom of the Plot Properties Editor.

27. Click the **Choose** button next to the Separate X-Axis option and select the variable *ServoMotor\omega_abs*.

Your Plot Properties Editor should now look like:
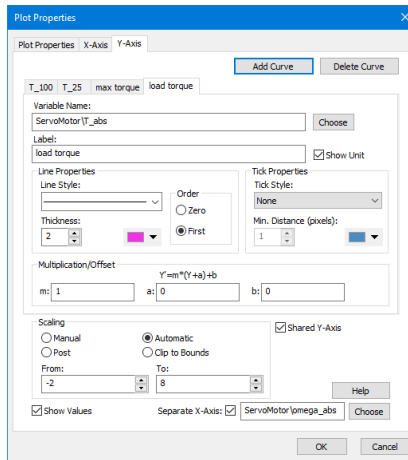

You can choose a separate x-axis for every plotted variable.

28. **Run** a new simulation. The extra plot will look like the next figure.
Torque speed plot with the duty cycle lines and the load torque.

The load torque, i.e. the torque that is applied by the motor to drive the load, is completely under the 25% duty cycle curve. This means the motor will never overheat when once every 4 sec there is a step change of 1 s. The motor curve is even under the 100% duty cycle. This means it wouldn't overheat if we would apply 4 steps in 4 s. If we stick to the 25% duty cycle, we might choose a lighter motor.

29. Go to the Editor. Select the **ServoMotor model** and click **Go Down**.

30. In the **Servo Motor Editor** choose the motor with keyname **252463 s**.

This is a motor with less power (156 W vs. 312W), a smaller maximum torque (5.14 Nm vs. 6.59 Nm) and a higher maximum speed (10000 rpm vs. 7000 rpm)

31. Click **OK** to close the Servo Motor Editor.

32. In the Editor from the **Mode**l menu click the **Check Complete Model** command. This will ensure that the new motor will be used in the simulation.

33. In the Simulator from the **Simulation menu** choose **Clear** - **All Runs.**

34. Now **run** a new simulation. The torque speed plot will now look like:
The motor torque crosses the 25% duty cycle line. This means the motor will overheat.

The load curve now crosses the 25% duty cycle line. This means the motor will heat up higher than the allowed maximum. To prevent this from happening we will use the higher maximum speed of the motor. This can be done by changing the gearbox ratio.

35. In the **Simulator**, from the **Properties** menu click the **Parameters** command. **Change** the gearbox ratio *Gear\i* to 40.

36. **Clear** the previous simulation and **run** a new simulation. The torque speed plot will now look like:
Changing the gearbox ratio will keep the motor torque under the 25% duty cycle line.

Now the load curve does not cross the 25% duty cycle line anymore. You can also load the model ServoMotor2 from the Getting Started\Mechatonic Toolbox section of the library to show the final result.

You can load the model *ServoMotor3.emx* from the Getting Started\Mechatonic Toolbox section of the library, to see a long simulation of the motor temperature. In this model the setpoint generation is performed by a motion profile block which outputs a repeating signal with a duty cycle of 25%. As you can see from the plot the coil temperature increases to 43 °C which is far below the maximum temperature of 125 °C.
A simulation of the motor temperature.

14 Real Time Toolbox

14.1 Real Time Toolbox

The *Real Time Toolbox* provides you with C-code generation tools and templates for all kinds of different targets and platforms.

With 20-sim you are able to generate C-code as well as MATLAB code for every 20-sim model that you have created, whether it is a continuous or discrete-time model. The C-code can be created for several targets, like MATLAB Simulink, but also for Rapid Prototyping (RP) systems and Hardware-In-the-Loop (HIL) simulations.

Matlab Simulink

Generating C-code for use in MATLAB Simulink also includes a submodel block with input and output terminals. 20-sim uses the MEX-compiler, to compile this code directly into an S-function. These S-functions can also be used in the Real Time Workshop in order to generate code for a specific platform, for instance xPC Target.

C-code

20-sim can generate standalone C-code for use in C and C++ programs. The generated C-code is supplied with several fixed step simulation algorithms to assure that it will run in real-time. The Euler and RungeKutta 4 method are supported by default.

All C-code templates are open and can be adapted by the user to assign compilers, run ftp-sessions and automate almost everything between the 20-sim code generation and the actual running of the code on a (remote) machine. During C-code generation support code is generated for 20-sim operators like matrix calculations and trigonometric functions.

20-sim 4C

With the Real-Time Toolbox you can generate code for 20-sim 4C. 20-sim 4C is a program that is sold separate from 20-sim. 20-sim 4C is a prototyping environment that enables you to connect 20-sim models to physical systems. The models can be executed as real-time C-code on hardware like PC's or ARM-9 based processor boards. This enables you to perform various tasks:

- **Measurement and Calibration:** From 20-sim 4C you can export C-code that will operate and read sensors.
- **Machine Control:** With 20-sim 4C you can export code to external targets to control the operation of machines. In 20-sim 4C you can start and stop the controller and change parameters during run-time.

- **Rapid Prototyping:** 20-sim models can be exported to 20-sim 4C with the click of a button and executed on a target with a second click. This makes 20-sim 4C a valuable tool for rapid prototyping.

20-sim 4C allows you to run C-code, generated in 20-sim, on real machines.

More information on 20-sim 4C can be found on the 20-sim website www.20sim.com.

15 Time Domain Toolbox

15.1 Time Domain Toolbox

During simulation, the time domain behavior of a model is calculated. Based on this time-domain behavior, the model can be analyzed. A set of powerful methods for time domain analysis is available in 20-sim.

Parameter Sweep

Parameter sweeps are multiple simulations with a variation of parameter values. It is a quick method to see how your model behavior depends on the parameter values.

Optimization

Using Optimization, you can maximize the performance of your model by varying specified model parameters. Predefined or user defined cost functions can be used as a measure of model performance. A number of well known optimization methods can be used to minimize or maximize these cost functions.
Using optimization to find controller parameters with optimal disturbance rejection.

Curve Fitting

With Curve Fitting you can fit model performance to a given result by variation of parameters. It is a very useful method to optimize model parameters when measurement data is available.

Sensitivity Analysis

Sensitivity Analysis is used to investigate the effect of parameter variation on model performance. The change in performance divided by the parameter change is plotted in a table. Sensitivity Analysis is a well-known method in production engineering to find critical systems tolerances in early stages of the design

Monte Carlo Analysis

With Monte Carlo Analysis, you can perform a predefined number of simulation runs with statistical variation of parameter values. Results can be shown as histograms or inspected numerically. Monte Carlo Analysis is a powerful method to find out worst case model behavior.

Variation Analysis

With Variation Analysis you can find the statistical range of parameter values that yield a model with a certain performance level. Variation Analysis is a powerful method to find a measure for system tolerances in the early stage of the design.

15.2 Parameter Sweep

Introduction

Using the Parameter Sweep option of the *Time Domain Toolbox*, you can perform a predefined number of simulation runs with variation of parameters / initial values.

Example

1. From the **Getting Started Manual\Time Domain** Toolbox library open the model **ParameterSweep**.

2. Open the **Simulator**.

3. In the **Simulator**, from the **Tools** menu select the **Time Domain Toolbox** and then **Parameter Sweep**.

A window will open, asking you which parameters values should be changed during the multiple simulations. Here the parameters **Lever\L\r** and **Bellows\K\k** are already entered.

4.   Click the **Next** button.

Result

A window opens asking you which result (optional) should be shown after the simulations:

Here the integral of the pipe air flow (e.g. the total air volume) is chosen. For a parameter sweep, you do not have to fill in a value, but it is nice to see which set of parameters will give a maximum air flow.

5.   Click the **Next** button.

Run options

A window will open, asking some simulation run options:
You can select the following items:

- *Steps*: Number of simulations runs.
- *Copy from States*: Use the result of the previous simulation runs as the starting value
- numerical output of the parameter sweep.
- *Join Parameter Variation*: Change all parameters simultaneously.
- *Clear After Every Run:* Clear the simulation plot when a new simulation run starts.
- *Redraw After Every Run*: Update the scaling after every run.

Here the two parameters will be varied 5 times independently, requiring 25 simulation runs.

6.   Click the **Next** button.

A window will open with a summary of the chosen options. If your are not satisfied you can use the **Back** button to go to a previous window and change settings.

7.   Click the **Finish** button to close the Multiple Run Wizard.

8.   From the **Simulation** menu click the **Multiple Run** command to perform the Parameter Sweep.

Now the Simulator will perform the 25 runs and show the results in the plots. If you click View - Numerical values, you can inspect the runs and see that run number 10 will give the largest air flow.
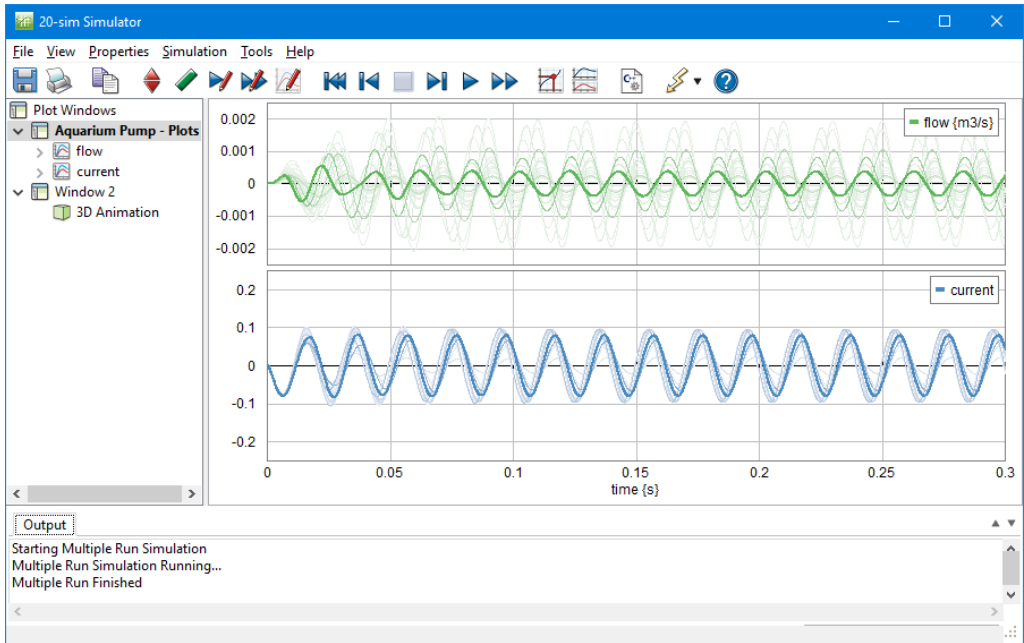

Parameter Sweep Results

After simulation has been done, a Multiple Run Results window will open, showing the minimum and maximum value of the result and chosen parameters.
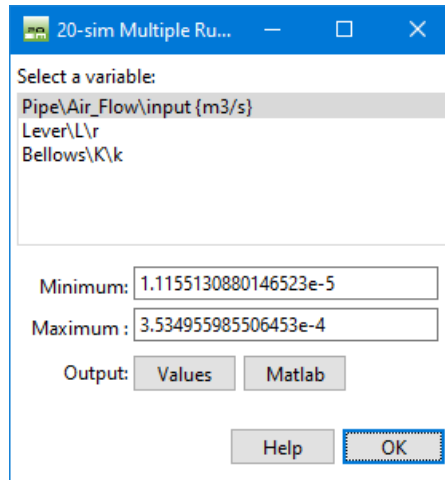

Here the maximum and minimum air flow volume is shown. You can select the following items:

- *Values*: Choose this button to open the list that shows the numerical output of the parameter sweep.

- *Matlab*: Export the results to Matlab.
- *OK:* Close the Multiple Run Results Window.

You can always re-open the Multiple Run Results window, by selecting the **Multiple Run Results** command of the **View** Menu.

9. By choosing the **Values** button, a new window is opened, showing the numerical results of the parameter sweep.

In the **Results** list of this window the subsequent runs are shown and (if available) the value of the chosen result:
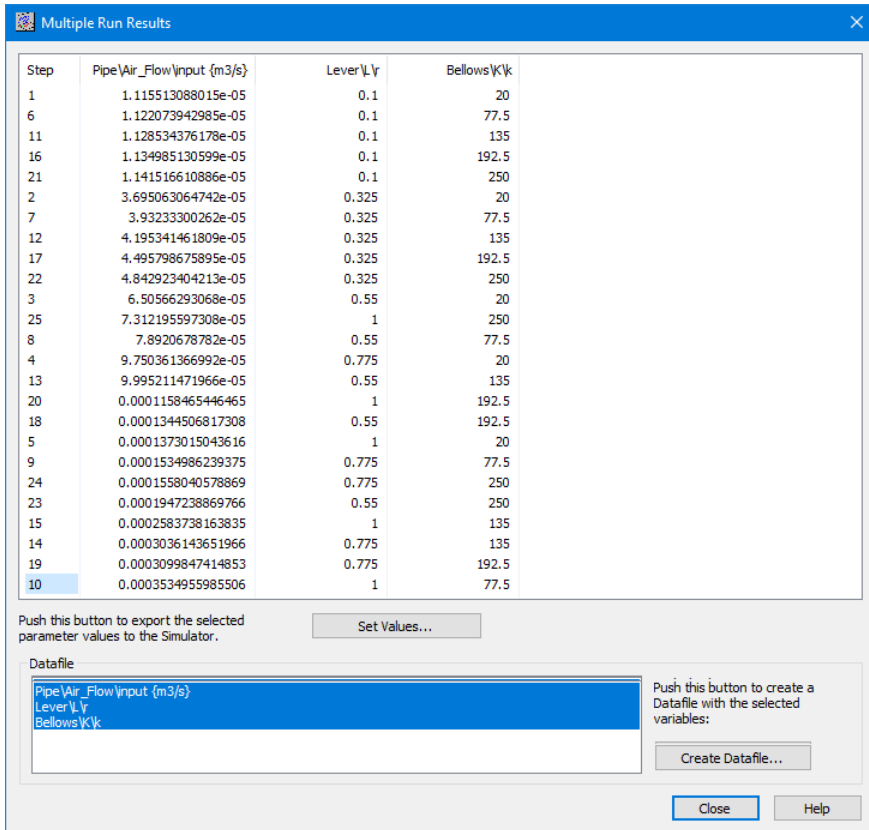

Here the 25 runs are shown with the parameter values and resulting air flow volume. As you can see, run number 10 gives the maximum air flow. You can select the following items:

- *Step*: Click on *Step* or the other column headers to sort the runs.
- *Set Values*: Choose the values of the selected run, as new parameter values of your model.
- *Create Datafile*: Use this button to store the values of the selected variables on file. Use the control-key and shift-key to make multiple selections.

15.3 Optimization

Using the Optimization option of the *Time Domain Toolbox*, you can optimize a given result using variation of parameters / initial values.

Optimization Method

1. From the **Getting Started Manual\Time Domain** Toolbox library open the model **Optimization**.

2. Open the **Simulator**.

3. In the **Simulator**, from the **Tools** menu select the **Time Domain Toolbox** and then **Optimization**.

A window opens asking you which optimization method should used:
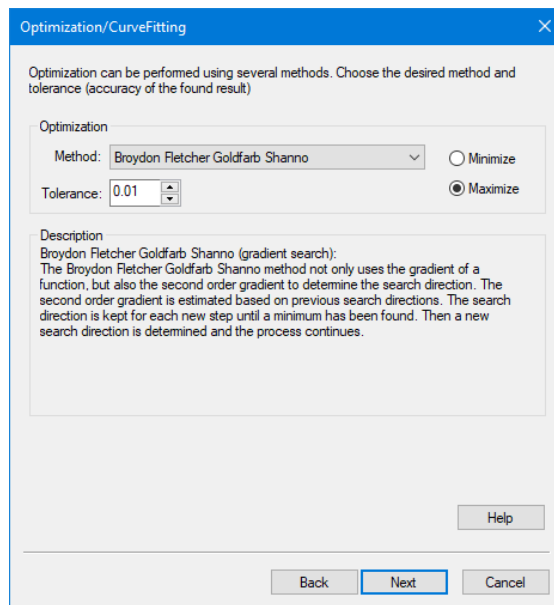

Here the optimization method is already chosen.

4. Click the **Next** button.

Parameters / Initial Values

A window will open, asking you which parameters values should be use for the optimization. Here the parameters **Lever\L\r** and **Bellows\K\k** are already entered.

5.   Click the **Next** button.

Result

A window opens asking you which result should optimized:

Here the integral of the pipe air flow (e.g. the total air volume) is chosen.

6. Click the **Next** button.

Run options

A window opens asking some simulation run options:
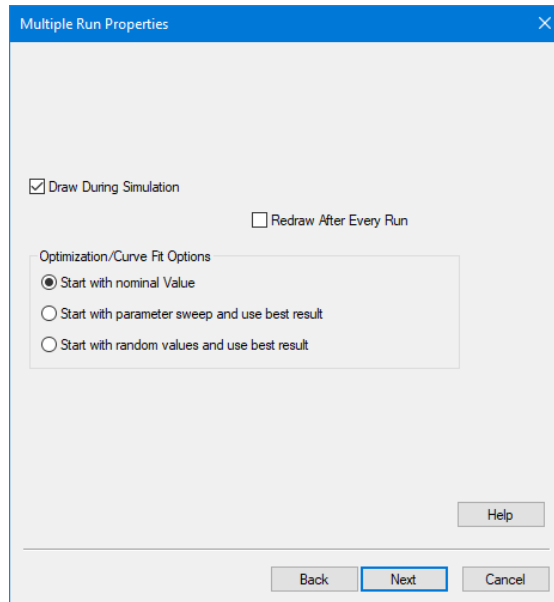

7. Click the **Next** button.

A window opens with a summary of the chosen options. If your are not satisfied you can use the **Back** button to go to a previous window and change settings.

9. Click the **Finish** button to close the **Multiple Run** Wizard.

10. From the **Simulation** menu click the **Multiple Run** command to perform the Optimization.

You will see the Simulator perform many simulation runs. After a maximum has been found on the starting run and the runs with the maximum air flow is shown.
Optimization Results

After simulation has been done, an Optimization Results window will open, showing the optimum value of the result and corresponding parameters:
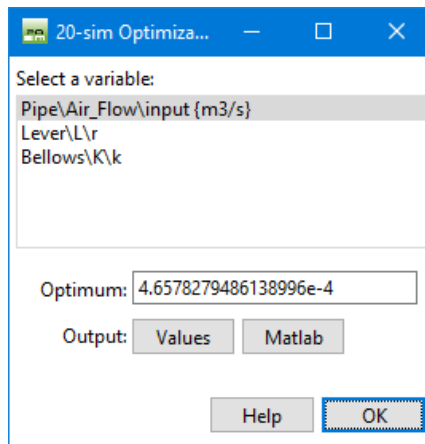

Here the maximum air flow volume is shown. You can select the following items:

- *Values:* Choose this button to open the list that shows the numerical output of the optimization runs.
- *Matlab:* Export the results to Matlab.
- *OK:* Close the Optimization Results Window.

You can always re-open the Multiple Run Results window, by selecting the **Multiple Run Results** command of the **View** Menu.

11. By choosing the **Values** button, a new window is opened, showing the numerical results of the parameter sweep.

In the **Results list** of this window the subsequent runs are shown and (if available) the value of the chosen result:

As you can see Here the 81 runs are performed and shown with the parameter values and resulting air flow volume. As you can see, run number 81 gives the maximum air flow. You can select the following items:

- *Set Values:* Choose the values of the selected run, as new parameter values of your model.

- *Create Datafile*: Use this button to store the values of the selected variables on file. Use the control-key and shift-key to make multiple selections.

15.4 Sensitivity Analysis

Using the Sensitivity Analysis option of the *Time Domain Toolbox*, you can detect which variations in parameter values will give the largest deviation of a given metric. If, for example, the metric is the accuracy of a machine, with sensitivity analysis you can detect how sensitive the machine is for parameter changes, with respect to that accuracy.

Sensitivity analysis starts with a simulation run with nominal parameter values. After the run a given result is monitored *(r)*. Then, one by one, each parameter *(pi)* is changed with a given percentage *(to pi + dpi)* and a simulation run is performed. After the simulation run the changed result is monitored *(r + dri)*. After all the runs, the results are displayed as sensitivities, where sensitivity is defined as the change in result divided by the change in parameter:

Si = dri / dpi

A large sensitivity means that the result is highly dependent of the parameter value. This can be used for optimization (change the parameter value) or design (change the design to make it less dependant of the parameter).

Parameters / Initial Values

1. From the **Getting** Started Manual\Time Domain Toolbox library open the model **SensitivityAnalysis**.

2. Open the Simulator.

3. From the **Tools** menu select the **Time Domain Toolbox** and then **Sensitivity Analysis**.

A window opens asking you which parameters / initial values should be changed for the sensitivity analysis:

As you can see the parameters have already been entered.

4. Click the **Next** button.

Result

A window opens asking you which result should be monitored for the sensitivity:

The integral absolute value of the position error is chosen here.

5. Click the **Next** button.
Run options

A window opens asking some simulation run options:

6. Click the **Next** button.

A window opens with a summary of the chosen options. If your are not satisfied you can use the **Back** button to go to a previous window and change settings.

7. Click the **Finish** button to close the Multiple Run Wizard.

8. From the **Simulation** menu click the **Multiple Run** command to perform the Sensitivity Analysis.

Now the Simulator will perform a number of simulation runs and show the results.

Sensitivity Analysis Results

After simulation has been done, a Sensitivity Analysis Results window will open, showing the sensitivities:

As you can see, a change in pulley2 radius will by far give the largest change in error. I.e. the system is very sensitive to changes in the pulley2 radius. You can select the following items:

- *Multiple Run Values*: Choose this button to open the list that shows the output of the various runs performed during the sensitivity analysis.

- *Close*: Close the Sensitivity Analysis Results Window.

You can always re-open the *Multiple Run Results* window, by selecting the *Multiple Run Results* command of the View Menu.
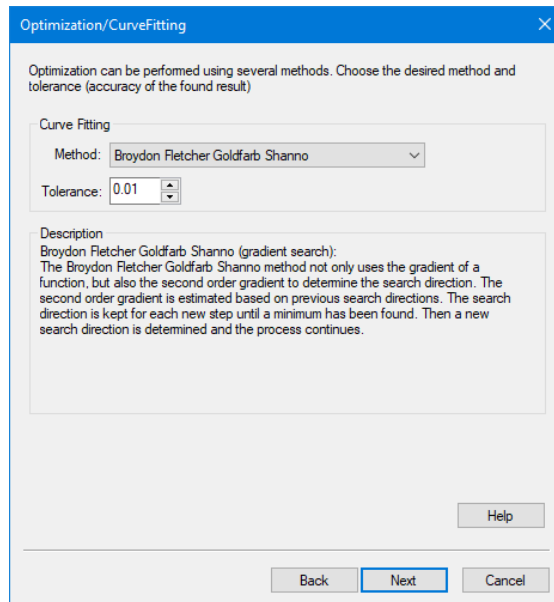

15.5 Curve Fitting

Using the Parameter Sweep option of the *Time Domain Toolbox*, you can fit your model to a given result using variation of parameters / initial values.

Optimization Method

1. From the **Getting** Started Manual\Time Domain Toolbox library open the model **CurveFitting**.

2. Open the **Simulator**.

3. From the **Tools** menu select the **Time Domain Toolbox** and then **Curve Fittting**.

A window opens asking you which optimization method should used for curve fitting:

Here the optimization method is already chosen.

4.   Click the **Next** button.

Parameters / Initial Values

A window will open, asking you which parameters values should be use for the curve fitting. Here the parameters **Model\omega** and **Model\zeta** are already entered.

5.   Click the **Next** button.

Result

A window opens asking you which result should minimized to fit your model (variable 1) to a given result (variable 2):

6. Click the **Next** button.

Run options

A window opens asking some simulation run options:
7. Select the desired run options and click the **Next** button.

A window opens with a summary of the chosen options. If your are not satisfied you can use the Back button to go to a previous window and change settings.

8. Click the **Finish** button to close the **Multiple Run Wizard**.

9. From the **Simulation** menu click the **Multiple Run** command to perform the Curve Fitting.

You will see the Simulator perform many simulation runs. After a good fit has been found on the starting run and the runs with the best fit is shown.
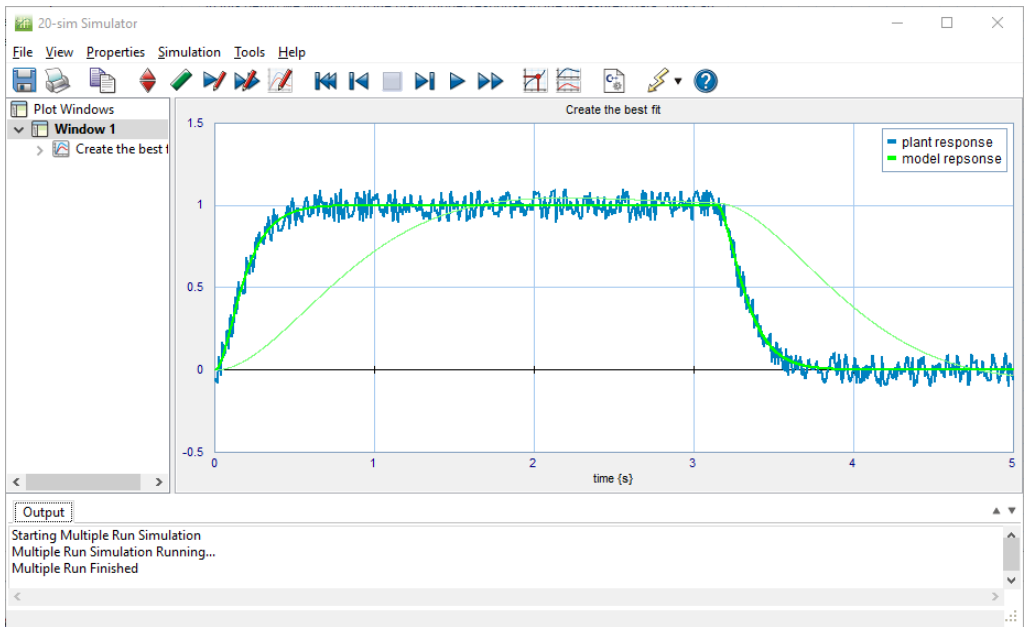

Optimization Results

After the curve fit has been done, the Optimization Results window will open, showing the minimum value of the result and corresponding parameters:
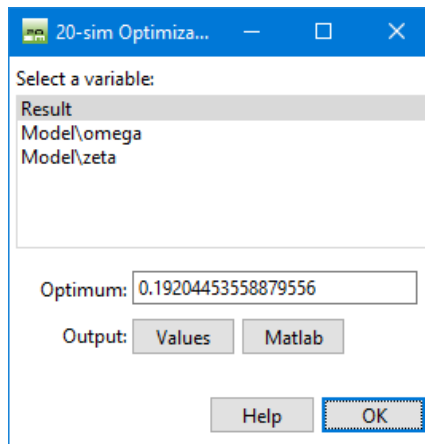

You can select the following items:

- *Values:* Choose this button to open the list that shows the numerical output of the curve fitting runs.
- *Matlab:* Export the results to Matlab.
- *OK*: Close the Optimization Results Window.

You can always re-open the **Multiple Run Results** window, by selecting the **Multiple Run Results** command of the **View** Menu.

11. By choosing the **Values** button, a new window is opened, showing the numerical results of the parameter sweep.

In the **Results list** of this window the subsequent runs are shown and the value of the chosen result:

Step	Result	Model\omega	Model\zeta
40	0.1920445355888	10.16995093388	0.9989880339799
41	0.1920445355888	10.16995093388	0.9989880339799

39	0.1922617116964	10.09412622656	0.9763719690616
30	0.1924870192246	10.15813283057	0.9775127397891
37	0.1933341700947	9.995673273623	0.9470066282161
29	0.1940909441524	10.24686930075	1.056223036228
28	0.1978301422628	10.29123753584	1.095578184448
23	0.2001091979768	10.42441371216	1.125094545612
24	0.2001259144949	10.32451371216	1.115194545612
27	0.2003085118854	10.31342165338	1.115255758558
21	0.2016980460018	10.32451371216	1.125094545612
25	0.2033869054759	10.32451371216	1.134994545612
22	0.2034998577369	10.22461371216	1.125094545612
26	0.2076147384864	10.03478607245	0.8681027094232
31	0.2200435491163	9.980659890217	0.8200921469109
12	0.2552573689155	8.252679944775	0.6289069667251
18	0.2828039895707	9.437916038901	0.625330820525
15	0.2849491468721	9.338016038901	0.615430820525

Push this button to export the selected parameter values to the Simulator.   **Set Values...**

Datafile
Result
Model\omega
Model\zeta

Push this button to create a Datafile with the selected variables: **Create Datafile...**

Close   **Help**

You can select the following items:

- *Set Values*: Choose the values of the selected run, as new parameter values of your model.

- *Create Datafile*: Use this button to store the values of the selected variables on file. Use the control-key and shift-key to make multiple selections.

15.6 Monte Carlo Analysis

Using the Monte Carlo analysis option of the *Time Domain Toolbox*, you can perform a predefined number of simulation runs with variation of parameter values according to a predefined distribution function.

Parameters / Initial Values

1. From the **Getting Started Manual\Time Domain** Toolbox library open the model **ParameterSweep**.

2. Open the **Simulator**.

3. From the **Tools** menu select the **Time Domain Toolbox** and then **Monte Carlo Analysis**.

A window opens asking you which parameters / initial values should be varied for the Monte Carlo analysis:

Two parameters have already been entered.

4. Click the **Next** button.

Result

A window opens asking you which result should be monitored during the Monte Carlo Analysis:

Here the integrated absolute error of the machine is chosen.

5.   Click the **Next** button.

Run options

A window opens asking some simulation run options:

Because this is a statistical method, we have to do many simulations runs. We therefore choose not to display the results in a plot to speed up simulation and prevent using too much computer memory.

6. Click the **Next** button.

A window opens with a summary of the chosen options. If your are not satisfied you can use the **Back** button to go to a previous window and change settings.

7. Click the **Finish** button to close the Multiple Run Wizard.

8. From the **Simulation menu** click the **Multiple Run** command to perform the Monte Carlo Analysis.

Monte Carlo Analysis Results

After the simulations have been done, a Monte Carlo Analysis Results window will open, showing the results:
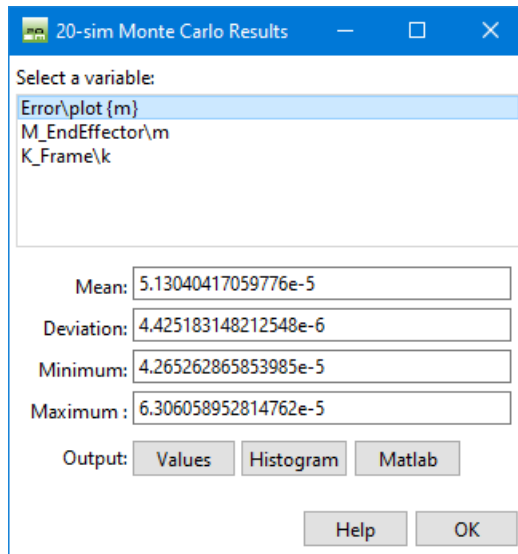

You can select the following items:

- *Values:* Choose this button to open the list that shows the output of the various runs performed during the Monte Carlo analysis.

- *Histogram:* Choose this button to open a histogram of the selected item.

- *Matlab*: Export the results to Matlab.

- *OK:* Close the Multiple Run Results Window.

You can always re-open the **Multiple Run Results** window, by selecting the **Multiple Run Results** command of the **View** Menu.

9. By choosing the **Values** button, a new window is opened, showing output of the various runs performed during the Monte Carlo analysis.
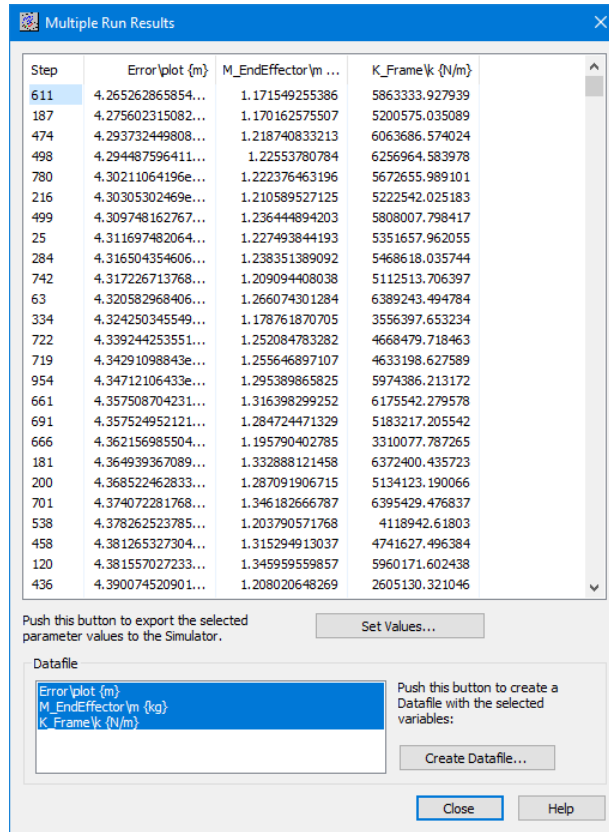

You can select the following items:

- *Set Values*: Choose the values of the selected run, as new parameter values of your model.

- *Create Datafile*: Use this button to store the values of the selected variables on file. Use the control-key and shift-key to make multiple selections.

By choosing the **Histogram** button, a new window is opened, showing distribution of the integrated absolute error:
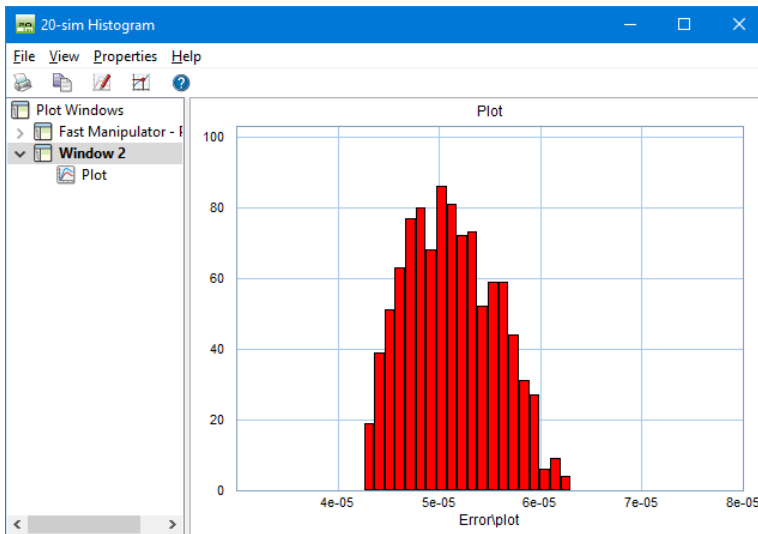

15.7 Variation Analysis

Using the Monte Carlo analysis option of the *Time Domain Toolbox*, you can perform a predefined number of simulation runs with variation of parameter values according to a predefined distribution function. We will then
restrict the parameter variation until the error is within certain bounds. This is called Variation analysis.

Parameters / Initial Values

1. From the Getting Started Manual\Time Domain Toolbox library open the model ParameterSweep.

2. Open the Simulator.

3. From the **Tools** menu select the **Time Domain Toolbox** and then **Variation Analysis**.

A window opens asking you which parameters / initial values should be varied for the Variation analysis:

Here the integrated absolute error of the machine is chosen.

5. Click the **Next** button.

Result

A window opens asking you which result should be monitored during the Variation Analysis:

Two parameters have already been entered.

6.   Click the **Next** button.
Run options

A window opens asking some simulation run options:

Because this is a statistical method, we have to do many simulations runs. We therefore choose not to display the results in a plot to speed up simulation and prevent using too much computer memory.

6.   click the **Next** button.

A window opens with a summary of the chosen options. If your are not satisfied you can use the **Back** button to go to a previous window and change settings.

7.   Click the **Finish** button to close the **Multiple Run Wizard**.

8.   From the **Simulation menu** click the **Multiple Run command** to perform the Variation Analysis.

Variation Analysis Results

After simulation has been done, a Variation Analysis Results window will open, showing the results. A histogram shows the distribution of the result. Using the slider bar you can see how restraining the distribution of the parameters effects the distribution of the result.
The histogram shows the value of the integrated absolute error on the x-axis and the number of runs on the y-axis.

You can select the following items:

- *Slider Bar*: Select a parameter and restrict its distribution with the slider bar. You will see the results distribution change.
- *Multiple Run Values*: Choose this button to open the list that shows the output of the various runs performed during the Variation Analysis.
- *OK:* Close the Multiple Run Results Window.

You can always re-open the Multiple Run Results window, by selecting the **Multiple Run Results** command of the **View** Menu.

9. Change the slider bar for the two parameters and inspect the results.

You can see the following:

- An increase of the end effector mass will not reduce the maximum error.

- A decrease of the stiffness will not reduce the maximum error.

We can slide the maximum mass to the middle and minimum stiffness to the middle to decrease the error:
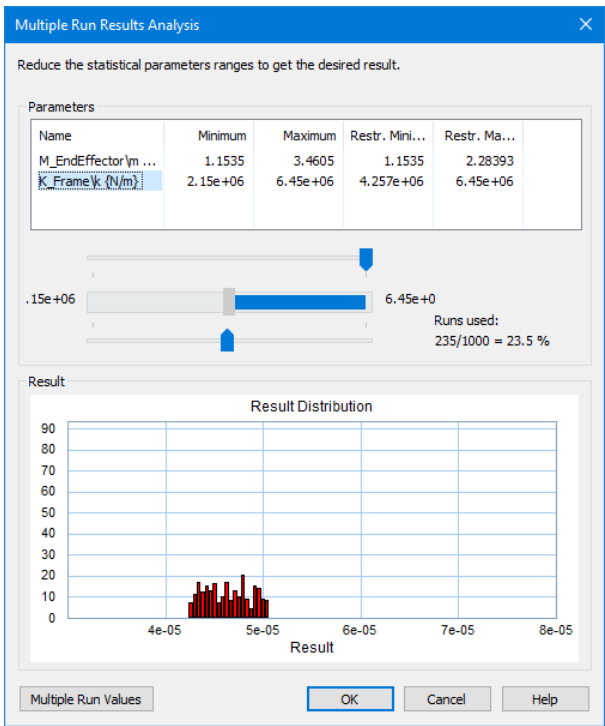

16 Scripting Toolbox

16.1 Introduction

20-sim scripting allows you to run tasks in 20-sim automatically using specialized scripting functions. With these functions you can open models, run simulations, change parameters, store results and much more. Scripting support was introduced in 20-sim 4.4.

20-sim session automated by a script in Octave, Matlab or Python.

These scripting functions are not very useful stand-alone, but you can use them to write scripts to automate various tasks in 20-sim.
20-sim provides a set of script functions for numerical computation environments like Octave and Matlab and for the Python programming language (since 20-sim 4.6).
The 20-sim scripting functions are based on XML-RPC calls, so any other programming language with support for XML-RPC can be used to automate various 20-sim steps.

In this chapter you will learn how to run basic scripts and make scripts on your own.

The next sections explain:

* **Installation for scripting**:
  o *20-sim:* enabling the XML-RPC scripting interface in 20-sim
  o *Octave:* installing Octave as scripting environment
  o *Matlab:* installing Matlab as scripting environment
  o *Python:* installing Python as scripting environment
* **Prepare Scripting Folder:** extract the 20-sim scripting functions and documentation to your work directory.
* **Basic Script:** run your first script and see how a basic script is made in Octave/ Matlab or Python.
* **Advanced Scripts:** see how you can expand the basic script to perform more advanced tasks in Octave/Matlab.
* **Writing your own Scripts:** How to write your own scripts in Octave/Matlab or Python.

Note: Scripting is not supported in the 20-sim Viewer/Demonstration Version. If you would like to try the scripting functionality, you will need licensed 20-sim version or a trial license.

16.2 Installation for Scripting: 20-sim

20-sim uses XML-RPC as a protocol to communicate scripting functions with external packages. By default the XML-RPC interface is turned on only for your local computer (listening on the TCP ports **5580** and **5520)**.

To enable/disable and configure the 20-sim scripting support:

1. Open **20-sim**.

2. Go to **Tools - Options** and select the **Scripting Server** tab.
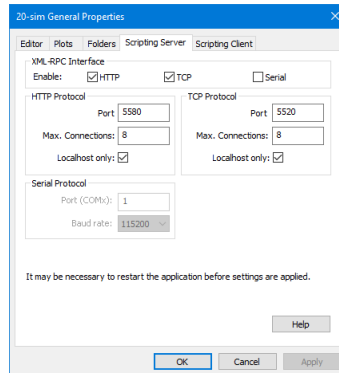

Scripting Interface settings tab.

3. To enable the 20-sim scripting support, make sure that the **HTTP** and **TCP** checkboxes under *XMLRPC Interface* are enabled.

By default, 20-sim will only accept scripting connections from your local computer (**Localhost only** option is enabled).

Your firewall may generate a warning message and ask you to allow network communication for 20-sim.

4. Set the **firewall** to **allow communication**.

16.3 Scripting Menu

If you store the scripts in a folder "Scripting" next to your 20-sim model, a Scripting menu will appear in the 20-sim Editor.

The Examples\Scripting folder contains models with scripting. If you open one of these models, the Scripting menu will be visible showing several scripts. You can run these scripts directly from the menu.

16.4 Scripting in Octave/Matlab

Installation for Scripting: Octave

What is Octave?

GNU Octave is a high-level language, primarily intended for numerical computations. The package is open source and can be freely distributed. GNU Octave offers functionality similar to Matlab users. If you have experience with Matlab, using Octave will be familiar. Users with no experience with Octave nor Matlab are advised to read a proper introduction to GNU Octave first. You will find lot of pages and videos on the Internet.

Installation

The Windows versions of Octave 7.2.0, 7.1.0, 6.x, 5.x, 4.x, 3.8.x, 3.6.x have been tested with 20-sim scripting at the time of this release.
Note that for older versions of Octave only the 32-bit Octave is supported. 64-bit versions of Octave are supported since Octave 4.2.1.

First choose the Octave version you wish to install and go to the corresponding section below:

Octave 7.x / 6.x / 5.x / 4.x

1. Go to: https://www.gnu.org/software/octave/

2. Go to the download page and download the Windows installer (direct link: https://ftp.gnu.org/gnu/octave/windows/octave-7.2.0-w64-installer.exe)

3. **Run** the installer and follow the wizard. The steps below assume default installation settings.

4. **Octave 4.0.x only:** Unfortunately Octave 4.0.x has a Windows specific bug in its internal run() function. This bug is resolved in Octave 4.2 and above.
    For Octave 4.0.x you will need to manually replace the default run() implementation with a corrected version. **Copy** the file:

    ```
    C:\Program Files (x86)\20-sim 5.0\Scripting\Octave-patch\4.0.0
    \run.m
    ```

    or on 32-bit versions of Windows:
    ```
    C:\Program Files\20-sim 5.0\Scripting\Octave-patch\4.0.0\run.m
    ```

    to:

    ```
    C:\Octave\Octave-4.0.0\share\octave\4.0.0\m\miscellaneous\run.m
    ```

5. **Launch Octave** from the Start menu or using the script: `C:\Octave\Octave-x.y.z\octave.bat`

6. **Execute** the following commands to make sure that the io, control and signal are installed.
    ```
    pkg install -forge io
    pkg install -forge control
    pkg install -forge signal
    ```

The Octave GUI.

Your Octave installation is now ready to use.

Octave 3.8.x

1. Go to: http://www.20sim.com/downloads/files/ThirdParty/octave-3.8.2-2-installer.exe

2. **Run** the installer and follow the wizard.

3. **Launch Octave** using the script: C:\Octave\Octave-3.8.2\octave.bat

4. **Execute** the following commands to install packages io, control and signal:
   ```
   pkg install -forge io
   pkg install -forge control
   pkg install -forge signal
   ```

Your Octave installation is now ready to use.

Octave 3.6.x

1. Go to the Octave download site (http://sourceforge.net/projects/octave/.).

2. Click on the **Files** tab and click on **Octave Windows Binaries**.

3. Select the **Octave 3.6.4 for Windows MinGW installer**.

4. Now you can **download** the files **Octave3.6.4_gcc4.6.2_yyyyxxxx.7z** (Octave Installation) and **Octave3.6.4_gcc4.6.2_pkgs_yyyyxxxx.7z** (Octaveforge Packages).

5. Create an installation directory which doesn't have space chars (i.e. C:\Octave).

6. **Unzip** the file **Octave3.6.4_gcc4.6.2_yyyyxxxx.7z** and **copy** it to the installation directory.

7. Copy the **shortcut link** `C:\Octave\Octave3.6.4_gcc4.6.2.lnk` to your **desktop**. This is a shortcut to start Octave.exe.

Note: Unzipping can be done with programs like 7-zip (http://www.7-zip.org/)
Note: There is a bug with Windows 8 and running Octave. In order to use Octave start Octave with `octave.exe -i --line-editing`. See the Octave wiki webpage for more information.

8. **Unzip** the file **Octave3.6.4_gcc4.6.2_pkgs_yyyyxxxx.7z** and **copy** it to the installation directory.

9. **Launch Octave** (e.g. the link to Octave.exe).

10. **Execute** the following five rebuild commands from the Octave console (e.g. re-type every line followed by ENTER):

pkg rebuild -auto

```
pkg rebuild -noauto ad
pkg rebuild -noauto nan % shadows many statistics functions
pkg rebuild -noauto gsl % shadows some core functions
pkg rebuild -auto java
```

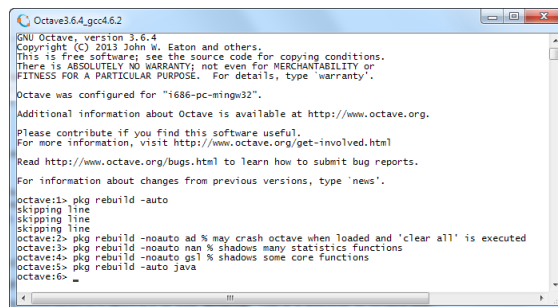

The Octave command window.

11. Close and **restart Octave**.

Setting the Octave Location

1. In the 20-sim *Editor* choose *Tools - Options - Scripting Client - Octave Folder* to enter the location where Octave is installed on your computer.

Installation for Scripting: Matlab

What is Matlab?

Matlab is a high-level language, primarily intended for numerical computations. The package is commercially distributed by the Mathworks. If you don't have the resources to purchase Matlab, you can run use Octave, which offers similar functionality.

Versions

Matlab R2011, R2012, R2013, R2014, R2015, R2016 and R2017 have been tested with 20-sim scripting but older and newer versions may also work fine.

Installation

See the Matlab documentation from the Mathworks for information on installing Matlab. No special (additional) installation is needed to use 20-sim scripting from Matlab.

Note: Scripting in Matlab is similar to Octave. You can type exactly the same commands as given for Octave in the next sections.

Prepare Scripting Folder

20-sim comes with a *Scripting Folder* that contains documentation of all scripting functions, the function library and example scripts. You have to install this folder to use scripting.

Installation

1. Open the **Install Scripting** program from the Windows *Start* menu (located under **20-sim 5.0**)
   - or -
   Go to the folder where 20-sim is installed (e.g. **C:\Program Files\20-sim 5.0 \Scripting** or **C:\Program Files (x86)\20-sim 5.0\Scripting**) and open **20simScripting.exe**

2. This will open a dialog where you can choose where to extract the 20-sim scripting files. **Change** the path to a local working folder of your choice (for example: **C: \Users\yourusername\Documents\20simscripting**)
20-sim Scripts extraction

Note: To write/modify scripts, the scripting folder should be accessible and writable by the user. Do not install the scripting folder on *C:\Program Files (x86)* or *C:\Program Files.*

Scripting Working Folder

For the remainder of this chapter, we use the name *scripting working folder* when we refer to the folder where you just extracted the 20-sim scripting files.

Contents

Your newly created *scripting working folder* contains a number of subfolders:

1. **Models:** This folder contains the 20-sim models and data files that are used for the example and tutorial scripts .

2. **Octave:** This folder contains all Octave/Matlab scripting functionality and documentation

   a. **documentation**: This folder contains the scripting API documentation: a list of supported functions and their syntax. It is a copy of the help file that you can open in the 20-sim **Editor** by selecting **Help** - **Octave Scripting API**.

      Note: the API documentation is also accessible from the Windows *Start* menu under *20-sim 5.0\Scripting API documentation*

   b. **library**: This folder contains the core scripting functions.

   c. **tutorials**: This folder contains basis scripts with a step by step explanation. You can use these scripts as a base for your own scripts.

   d. **examples**: This folder contains some more advanced scripts.

3. **Octave-patch:** This folder contains modified Octave scripts for certain Octave versions to fix bugs in the core Octave scripts that are not yet fixed in the latest release (currently 4.0.0)

4. **Python:** This folder contains all Python scripting functionality and documentation (see the Scripting in Python section for more information).

Basic Script

When the scripting files are properly installed in your *scripting working folder*, we can run some tutorial scripts. Tutorial scripts are a step by step demonstrations of usage of the scripting functionality in 20-sim. These scripts are found in the *tutorials* subfolder of the *scripting working folder*. We will start with a basic script that opens and runs a 20-sim model.

1. Open **20-sim**.

2. Open **Octave** (or **Matlab**).

3. In Octave/Matlab, change the local working directory to the tutorial folder inside your *scripting working folder* . E.g . type:

   ```
   cd 'C:\Users\yourusername\Documents\20simscripting\Octave\tutorials'
   ```
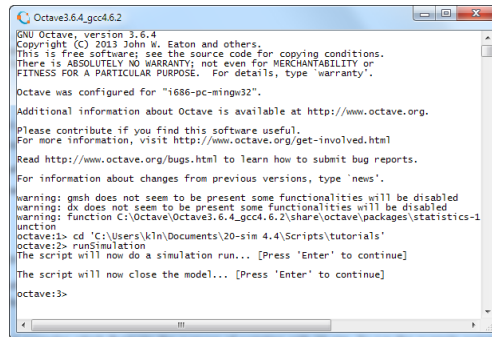

Note: 20-sim should be open before running the script!

4. In Octave/Matlab, execute the following command (e.g. type the following **case sensitive** command followed by ENTER):

   ```
   runSimulation
   ```

Note: Octave may give a cryptic "*undefined near line x column 1*" message, if you type the command as `runsimulation` instead of `runSimulation`!

5. Now Octave / Matlab will give a message and ask you to press **ENTER** to continue.

The model *ControlledSystem.emx* is loaded into 20-sim and simulated.

6. Again Octave/Matlab will give a message and ask you to press **ENTER** to continue.

Now the simulation and model will be unloaded.

Inspecting the script

To see how the script is made, you can inspect it with a text editor.

1. Open a file browser and go to the tutorials folder (e.g. C:\Users\yourusername \Documents\20simscripting\Octave\tutorials)

2. Open the file *runSimulation.m* with a text editor like **Notepad**.

Core Functions

The core functions of the *runSimulation* script are:

- **addpath**: The script starts with the command addpath('../library/xxsim'); This will enable Octave / Matlab to use the 20-sim scripting functions that are stored in the library subfolder of your scripting working folder.
- **xxsimConnect**: This command opens a connection to 20-sim.
- **xxSimOpenModel**: This command opens a model in 20-sim by giving the filename including the full path.
- **xxsimProcessModel**: This command will process the model.
- **xxsimRun**: This command will run a simulation.
- **xxsimCloseModel**: This command will remove the simulation model from 20-sim.

These functions are the basis of scripting in 20-sim and will be present in this order in most scripts. Therefore you can use the script *runSimulation.m* as a template for any new script that you create.

Advanced Scripts

Now that we have seen the core functions of a script we will run and check some more advanced scripts.

1. Open **20-sim**.

2. Open **Octave** (or **Matlab**).

3. In Octave/Matlab, change the local working directory to the tutorial folder inside your scripting working folder. E.g . type:

```
cd 'C:\Users\yourusername\Documents\20simscripting\Octave\tutorials'
```

Set Parameter Values

4. In Octave/Matlab, execute the following script (e.g. type the command followed by ENTER):

```
SetParameterAndRun
```

This script will open the model *ControlledSystem.emx* and run a simulation. Then a model parameter is changed and a second simulation run is performed. As explained in the previous topic, you can inspect the script in a text editor.

Compared to the basic script you will find a new function:

- **xxsimSetParameters**: This function is used to set the parameter in the model with the new value.

Multiple Runs

5. In Octave/Matlab, execute the following script (e.g. type the command followed by ENTER):

```
multipleRun
```

This script will open the model *ControlledSystem.emx* and run a simulation multiple times while changing a parameter. Then a model parameter is changed and a second simulation run is performed.

Read Parameter Values

6. In Octave/Matlab, execute the following script (e.g. type the command followed by ENTER):

```
readAndSetParameters
```

This script will open the model *ControlledSystem.emx* and run a simulation. Then a model parameter is read from file and changed accordingly in the model, followed by a second simulation run.

You will find these new functions:

- **addpath**: An additional path is given (../library/xxlib) to allow addtional (user defined) functions.

- **xxlibReadCsv**: This function is used to read a parameter name and value from a spreadsheet file.

Store Simulation Results

7. In Octave/Matlab, execute the following script (e.g. type the command followed by ENTER):

```
modelVerification
```

This script will open the model *ControlledSystem.emx* and run a simulation. After the run the simulation results are stored and plotted in Octave/Matlab. You will find these new functions:

- **xxsimSetLogVariables**: Define which variables are going to be logged during the simulation run.
- **xxsimGetLogVariables**: Export the logged variables after the simulation run to Octave/Matlab.

Examples

8. In Octave/Matlab, change the local working directory to the tutorial folder. E.g. type:

```
cd 'C:\Users\yourusername\Documents\20simscripting\examples'
```

here you can find more example scripts.

Writing your own Scripts

Example

We will show you how to write your own scripts using a simple example. We assume that you have installed a scripting folder and its location is:

```
'C:\Users\yourusername\Documents\20simscripting'
```

of course you can use own location. We will copy a 20-sim model to the scripting folder and write a script that will open this model in 20-sim and run a simulation.

1. **Copy** the example model **FastManipulator.emx** to the Octave\tutorials folder. E.g copy:

```
'C:\Program Files (x86)\20-sim 5.0\Models\Examples\Drivetrains
\FastManipulator.emx'
```

to

```
'C:\Users\yourusername\Documents\20simscripting\Octave\tutorials
\FastManipulator.emx'
```

2. Open a text editor (e.g. notepad) and enter the following lines:

```
run('../library/xxsim/xxsimAddToPath.m');
xxsimConnect();
xxsimOpenModel( 'FastManipulator.emx' );
xxsimProcessModel();
xxsimRun();
xxsimDisconnect();
```

3. **Save** the text file as:

```
'C:\Users\yourusername\Documents\20simscripting\Octave\tutorials
\MyScript.m'
```

4. Open **20-sim**.

5. Open **Octave** (or **Matlab**).

6. In Octave/Matlab, change the local working directory. Type in the command line:

```
cd 'C:\Users\yourusername\Documents\20simscripting\Octave\tutorials'
```

7. In Octave/Matlab, run your own script. Type in the command line:

```
MyScript
```

Now you will see the model being loaded in 20-sim and a simulation being run.

Writing your own scripts

In the tutorial folder there are more scripts. Use these as a template for writing you own scripts and follow the guidelines below:

Location

Create your own subfolder inside your scripting working folder. This allows you to update the 20-sim scripting files when new versions of 20-sim are released.

Functions

You can find help on scripting functions in the 20-sim **Editor** by selecting **Help** - **Octave Scripting API**.

16.5 Scripting in Python

Installation for Scripting: Python

What is Python

Python is a general-purpose high-level programming language with an emphasis on code readability and writing algorithms in fewer lines of code than other programming languages. Python is open-source and managed by the Python Software Foundation. It has an extensive standard library and can be extended with many external libraries including a rapidly growing set of scientific and mathematical libraries such as SciPy, NumPy and Sympy and an extensive plotting library Matplotlib. 20-sim scripting has been tested with the following versions of Python: Python 2.7.x, Python 3.4.x-3.7.x (32-bit and 64-bit).

Installation

During installation of 20-sim, you are asked to install the (optional) **Python 3.7 package**. We advise to keep the default setting (**Yes**) which will install the Python 3.7 installation that includes 20-sim scripting support and the following packages: NumPy, Matplotlib, Sympy, Pandas and IPython. This installation provides just enough support to get started with 20-sim scripting. However, it does not provide a development IDE or an extensive set of scientific and mathematical libraries.

Prepare Scripting Folder

20-sim comes with a *Scripting Folder* that contains documentation of all scripting functions, the function library and example scripts. You have to install this folder to use scripting.

Installation

1. Open the **Install Scripting** program from the Windows *Start* menu (located under *20-sim 5.0*)
   - or -
   Go to the folder where 20-sim is installed (e.g. *C:\Program Files (x86)\20-sim 5.0\Scripting* or *C:\Program Files (x86)\20-sim 5.0\Scripting*) and open **20simScripting.exe**

2. This will open a dialog where you can choose where to extract the 20-sim scripting files. **Change** the path to a local working folder of your choice (for example: *C:\Users\yourusername\Documents\20simscripting*)
20-sim Scripts extraction

Note: To write/modify scripts, the scripting folder should be accessible and writable by the user. Do not install the scripting folder on *C:\Program Files (x86)* or *C:\Program Files.* For the remainder of this chapter, we use the name *scripting working folder* when we refer to the folder where you just extracted the 20-sim scripting files.

Contents

Your newly created *scripting working folder* contains a number of subfolders:

1. **Models:** This folder contains the 20-sim models and data files that are used for the example and tutorial scripts .

2. **Octave and Octave-patch:** These folders contain Octave/Matlab scripting functionality and documentation (see the Scripting in Octave/Matlab section for more information)

3. **Python:** This folder contains all Python scripting functionality and documentation:

   a. **controllab:** Folder containing the Python classes that allow communication with 20-sim.

   b. **documentation**: This folder contains the scripting API documentation: a list of supported functions and their syntax. It is a copy of the help file that you can open in the 20-sim **Editor** by selecting **Help** - **Python Scripting API**.

   c. **examples**: This folder contains some more advanced scripts.

   d. **tutorials**: This folder contains basis scripts with a step by step explanation. You can use these scripts as a base for your own scripts.

Basic Script

When the scripting files are properly installed in your *scripting working folder*, we can run some tutorial scripts. Tutorial scripts are step by step demonstrations of usage of the scripting functionality in 20-sim. These scripts can be found in the *tutorials* subfolder of the *scripting working folder*. We will start with a basic script that opens and runs a 20-sim model.
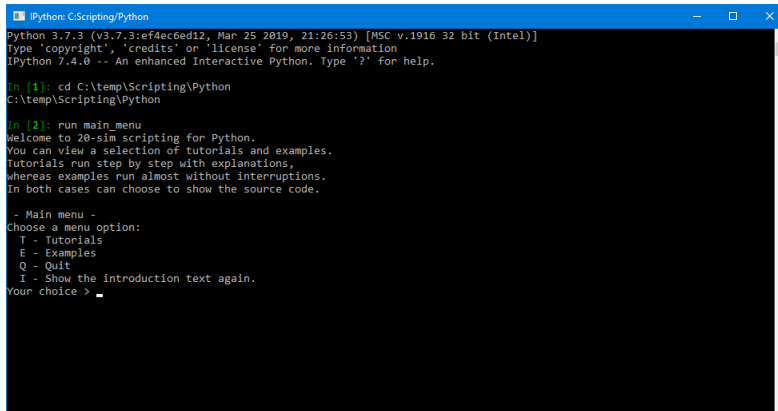

1. Open **20-sim**.

2. Open **IPython** (Interactive Python shell) from the Start menu (under 20-sim 5.0).

3. In IPython, **change** the local **working directory** to the tutorial folder inside your *scripting working folder* . E.g . type:

```
cd C:\Users\yourusername\Documents\20simscripting\Python
```

4. In IPython, execute the following **command** (e.g. type the following **case sensitive** command followed by ENTER):

```
run main_menu
```

Note that the `run` command is specific for IPython. For a standard Python session, you can start this script on the command line using: `python.exe menu.py`. This command will show a menu with several options including **T** for Tutorials.

IPython session for the tutorials

5. Select option **T** and press **ENTER** to show to enter the tutorials:

```
Welcome to the 20-sim scripting tutorials for Python.
These tutorials assume that the user has some experience with
scripting and Python.
If this is not the case, consider reading: https://www.python.org/
about/gettingstarted/
or use Octave for scripting if you are more familiar with it.
```

6. Press **ENTER** to continue:

```
 - Tutorial menu -
Select a tutorial:
1 - Run a simulation.
2 - Set a parameter in 20-sim, then run a simulation.
3 - Execute multiple runs with a changing parameter.
4 - Basic simulation result analysis.
5 - Read a parameter from a CSV file and set it in 20-sim.
6 - Retrieve 20-sim model variables and their properties.

Or choose a menu option:
  Q - Quit
  I - Show the introduction text again.
Your choice >
```

7. Press **1** followed by **ENTER**.*1*

```
In this tutorial the scripting interface will:
 - Open a 20-sim model (starting 20-sim if necessary)
 - Process and run the model
 - Close the 20-sim model
```

8. Press **ENTER**

```
The Python scripting interface will now connect to 20-sim.
If 20-sim is not running it will be started automatically.
```

9. Press **ENTER**

```
Connecting, please wait...

The scripting interface has successfully connected to 20-sim.
The tutorial model will be opened.
If you still have an open model. SAVE YOUR MODEL, unsaved changes
will be overwritten.
```

10. Press **ENTER**

```
The model ControlledSystem.emx has been opened in 20-sim.
The model will be processed and simulated.
The 20-sim plot window will open.
```

11. Press **ENTER** to load the model *ControlledSystem.emx* in 20-sim and to simulate it.

```
The tutorial will now close the 20-sim model and exit.
```

12. Press **ENTER** to close the simulation and this 20-sim model

Inspecting the script

```
Tutorial completed!
Do you want to see the source code? [y/N]
```

To see how the script is made, you can inspect it by choosing *y.* This will print the relevant script lines on the Python console. You can also open the real script in a text editor like **Notepad** by opening the file: C:\Users*yourusername*\Documents \20simscripting\Python\tutorials\run_simulation.py.

Important Functions

The important functions / lines of the *runSimulation* script are:

- **import controllab:** Tell Python to load the Controllab package with the 20-sim scripting functions in the XXSim() class.
- **my20sim = controllab.XXSim():** create a 20-sim scripting object
- **my20sim.connect()**: This command opens a connection to 20-sim.
- **my20sim.set_scriptmode():** Tell 20-sim that we are in scripting mode (does not show confirmation dialogs)

- **my20sim.open_model()**: This command opens a model in 20-sim by giving the file name including the full path.
- **my20sim.process_model()**: This command will process the model.
- **my20sim.run()**: This command will run a simulation.
- **my20sim.close_model()**: This command will remove the simulation model from 20-sim.

These functions are the basis of scripting in 20-sim and will be present in this order in most scripts.

Writing your own Scripts

Example

We will show you how to write your own scripts using a simple example. We assume that you have installed a scripting folder and its location is:

```
'C:\Users\yourusername\Documents\20simscripting'
```

Of course you can use own location. We will copy a 20-sim model to the scripting folder and write a script that will open this model in 20-sim and run a simulation.

1. **Copy** the example model **FastManipulator.emx** to the `Python\tutorials` folder. E.g copy:

```
'C:\Program Files (x86)\20-sim 5.0\Models\Examples\Drivetrains
\FastManipulator.emx'
```

to

```
'C:\Users\yourusername\Documents\20simscripting\Python\tutorials
\FastManipulator.emx'
```

2. Open a text editor (e.g. notepad) and enter the following lines:

```
import controllab
xxsim = controllab.XXSim()
xxsim.connect()
xxsim.open_model('FastManipulator.emx')
xxsim.process_model()
xxsim.run()
xxsim.disconnect()
```

3. **Save** the text file as:

```
'C:\Users\yourusername\Documents\20simscripting\Python\tutorials
\myscript.py'
```

4. Open **20-sim**.

5. Open **IPython**.

6. In IPython, change the local working directory. Type in the command line:

    ```
    cd 'C:\Users\yourusername\Documents\20simscripting\Python\tutorials'
    ```

7. In IPython, run your own script. Type in the command line:

    ```
    run myscript
    ```

Now you will see the model being loaded in 20-sim and a simulation being run.

Writing your own scripts

In the tutorial folder there are more scripts. Use these as a template for writing your own scripts and follow the guidelines below:

Location

Create your own subfolder inside your scripting working folder. This allows you to update the 20-sim scripting files when new versions of 20-sim are released.

Functions

You can find help on scripting functions in the 20-sim **Editor** by selecting **Help** - **Python Scripting API**.

Advanced Functionality

Python Distributions

When you need more functionality or prefer to use an IDE with syntax highlighting and debugging support, it is strongly advised to install one of the following external Python distributions or IDEs:

* Anaconda: The World's Most Popular Python/R Data Science Platform.
* Spyder: the Scientific PYthon Development EnviRonment with a powerful IDE for the Python language with advanced editing, interactive testing, debugging and introspection features and a a numerical computing environment based on SciPy, NumPy, Matplotlib and IPython.
* Python, extended with the Visual Studio IDE and Python Tools for Visual Studio.
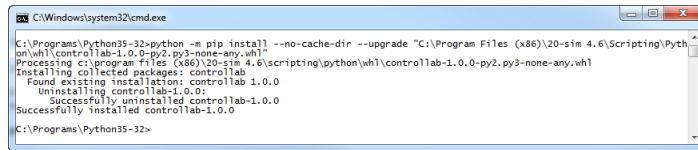

Running 20-sim scripts in Python distributions

To add the 20-sim scripting support to your Python distribution, you can use the Python pip command (installed by default since Python 2.7.10 and 3.4.x) to install the Controllab package.

1. Open a Windows command prompt (**cmd.exe**) and **type**:

```
cd YOUR_PYTHON_INSTALLATION_DIR\
python -m pip install --no-cache-dir --upgrade "C:\Program Files (x86)\20-sim 5.0
```

Note: use C:\Program Files\20-sim 5.0\ on 32-bit Windows systems.

Manual installation of the Controllab package in Python

17   Unity Toolbox

17.1 Introduction

Unity is a game engine developed by Unity Technologies that allows you to create high visual fidelity, 3D real-time interactive user experiences. The Unity Toolbox allows you to couple animations created in Unity with a 20-sim simulation model. When you run the 20-sim simulation, the Unity application is shown and moves/changes with the simulation.

Features

The Unity Toolbox will allow you to couple variables from a 20-sim model to objects in Unity. You can for example couple the position of an object with the simulated position. Every time you start a 20-sim simulation, a Unity window will be shown and changes/ moves while the 20-sim simulation advances.

The Unity Toolbox does exactly the same as the 20-sim 3D Animation, but is far more advanced. In Unity far more objects are available, the quality of rendering (shadow, light , etc.) is far better and there are more display options (single screen, multiple scree, VR/AR headsets etc.).

License

The Unity Toolbox does not come standard with 20-sim. It has to be purchased separately. If you have purchased the Unity Toolbox you will receive a license key that will enable the toolbox in 20-sim.

Example

To see a Unity Animation in action (if you have a valid license) open the example model *Examples\2D Mechanics\ScaraRobot_UnityAnimation.emx.*

Getting Started

To get started and learn to work with the Unity Toolbox, please have a look at the the Reference Manual.

License Required

The Unity Toolbox is not part of the set of standard toolboxes of 20-sim. It has to be purchased separately. When you have purchased the Unity Toolbox, you will receive a license code for 20-sim that will enable the plug-in to establish a run-time communication between 20-sim and Unity.

17.2 License Unity Toolbx

Purchase

The Unity Toolbox does not come standard with 20-sim. It has to be purchased separately. If you have purchased the Unity Toolbox you will receive a license key that will enable the toolbox in 20-sim.

No License

Without a valid license, the Unity IntroductionToolbox plug-in will stop the simulation and present an error message in the 20-sim Editor:

Message: Could not find Unity toolbox license.
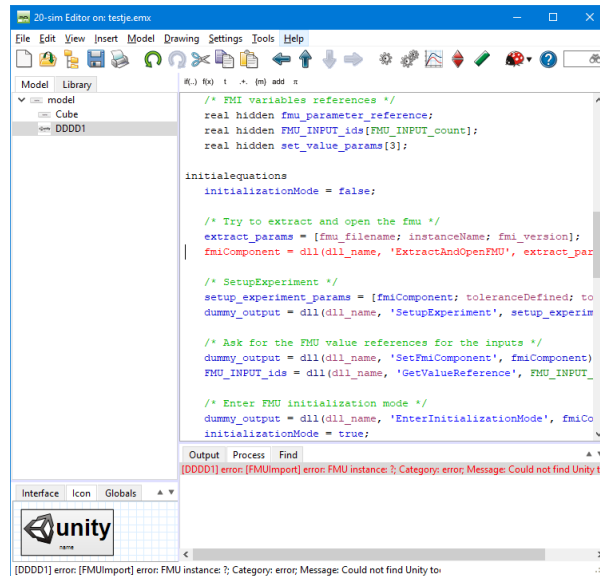

Error Message when you do not have a license for the Unity Toolbox.

17.3 How does the Unity Toolbox work?

Plug-in

The Unity Toolbox comes with a plug-in that has to be installed in Unity. The plug-in connects objects created in Unity with variables from a 20-sim model:

1.   You can connect objects manually with 20-sim variables.

2.   You can import a 20-sim 3D Scenery into Unity.

Coupling with 20-sim

When the Unity 3D Animation is completed and all objects have been connected with the proper variables from the 20-sim model, you can generate an .fmu (Functional Mockup Interface) file. You can drag and drop the .fmu file into the 20-sim model.

Simulation

The .fmu file will connect the 20-sim variables with the Unity application. When you start the simulation, the Unity application will start up. The Unity application will show moves/ changes during simulation. Set the 20-sim simulation to run in real-time to show the Unity application at the right speed.

Export

If you want to use the model with Unity Application on another location, make sure that you copy both the 20-sim model (.emx file) and the Unity application (.fmu file).

17.4 Installing

To get the Unity Toolbox running, you need a working version of Unity and install a plug-in for the Unity project that you are working on.

Unity

Unity is a commercial package by Unity Technologies. You can purchase the commercial Pro version or the free Personal version. There are various videos available on Youtube that show you how to install Unity. Note that the Unity Toolbox has been verified to work with Unity 2018.4, 2019.2, 2020.3.x (LTS), 2021.2.9f1. It is possible that it will work in intermediate and newer versions of Unity.

Plug-In

The Unity Toolbox comes with a plug-in that has to be installed in Unity. The plug-in is located in the 20-sim installation folder, usually at:

```
C:\Program Files (x86)\20-sim 5.0\addons\unity\20-sim-unity-toolbox-x.y.z.unitypa
```

Here x,y,z are the version number of the plug-in. For every new project in Unity, you have to install the plug-in in your version of Unity:

1. **Open** Unity and open/start a new (3D) project

2. From the **Assets** menu select **Import Package** and **Custom Package**.
The 20-sim Unity Toolbox ready for use.

3. **Select** the plug-in that is located in the 20-sim installaton folder:
   ```
   C:\Program Files (x86)\20-sim 5.0\addons\unity\20-sim-unity-toolbox-
   x.y.z.unitypackage.
   ```

4. Click **Import**.

5. From the **GameObject** menu select **20-sim** and **20-sim Unity Toolbox**.

Now the plug-in is installed and ready for use.
The 20-sim Unity Toolbox ready for use.

In the Hierarchy you will see the 20-sim Unity Toolbox listed. You can start to build your Unity application now.

17.5 Example: Cube

GameObjects

When you have installed the 20-sim Unity Toolbox correctly, it should be visible in Unity in the Hierarchy at the left. You can insert all kinds of Game Objects and connect them with variables coming from the 20-sim model. Let's start with a Cube.

1. From the **GameObject** menu select **3D Object** - **Cube**.

Now Cube object is visibe in the Hierachy.
Creating a Cube.

2. In the Hierachy **select the Cube** object.

3. In the Inspector at the bottom right click **Add Component** - **20-sim Unity Toolbox** - **20-sim coordinates**.

Now you will see a **20-sim Variable** component in the Inspector. Here you can connect the properties of the Cube with variables in your 20-sim model. If our 20-sim model contains a Submodel named *Cube* with three variables *x*, *y* and *z*, we can connect these with the position of the cube.

4. In the **20-sim Variable** component keep the Input/Output button on **Input**.

5. Add the variable names to the x-, y- and z-axis as shown in the next figure.
Connecting the position of the Cube with 20-sim variables.

In a similar manner you can create many more Game Objects and connect them with 20-sim variables.

Building a Unity Animation

When all objects have been defined we can generate a Unity Animation. Unity Animations are stored in an *.fmu* file.

6. In the Hierarchy at the left select **20-sim Unity Toolbox**.

7. In the Inspector at the right go to 20-sim Unity Toolbox and **Build Unity Animation**.

8. Enter the **Export Location** (a folder where you have read and write access) and **Animation Name** (e.g. Cube) and click **Build Unity Animation**.
Building a Unity Animation.

Now the file *Cube.fmu* will be created in the export location that you have chosen.

Importing the Unity Animation in 20-sim

We will drag and drop the Cube.fmu file into 20-sim and connect the x,y and z input with signal generators.

9. Open 20-sim

10. From the export location, drag and drop the file **Cube.fmu** to the Editor.

11. From the **Signal/Sources** library **drag and drop** the following submodels in the Editor:

- **WaveGenerator-Sine**

- **WaveGenerator-Cosine**

- **WaveGenerator-Saw**

12. Connect the **sine** model with the Cube model (**x**), the **cosine** model with Cube (**y**) and the **saw** model with Cube (**z**).
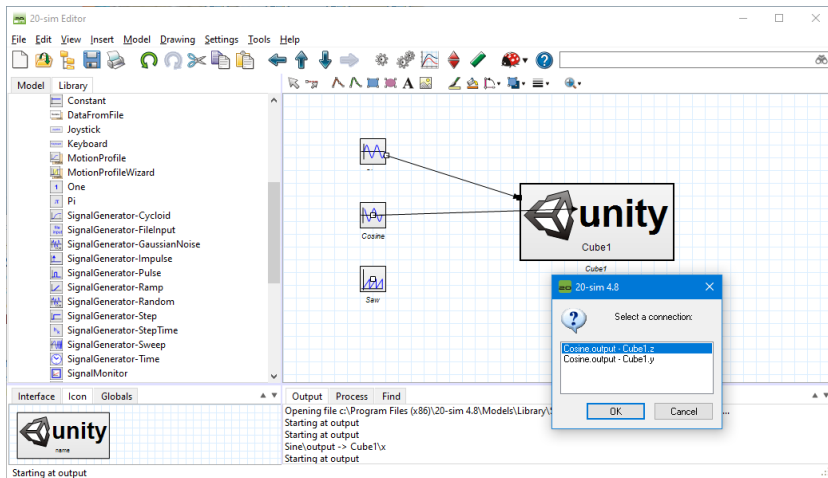

Connecting the FMU.

Running the Unity Animation

When you simulate the 20-sim model, a Unity Animation will pop up and run with the simulation. Generally the simulation will be much too fast to follow. Therefore we must force the simulation to run in real-time.

13. In the Editor, from the **Model** menu select **Start Simulator**.

14. In the **Simulator** from the **Properties** Menu select **Run**.
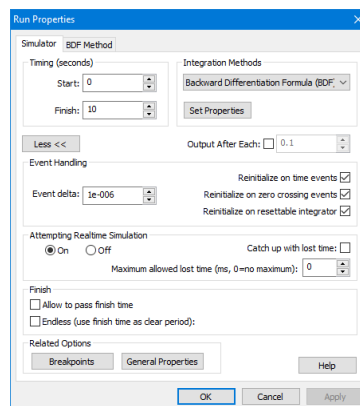

Forcing a real-time simulation.

15. In the Run Properties dialog click the **More** button and select **Attempting Realtime Simulation On**.

16. Click **Ok** to close the Run Properties dialog.

17. From the **Simulation** menu select **Run**.

Now you will see a Unity Animation window appear showing the cube moving.
The unity Animation with the cube.

18. In case Unity Animation Window is displayed in windowed mode, Click **Alt-Enter** to change the full screen mode.

17.6 Example: Scara Robot

Scenery

The easiest way to start building a Unity Animation is by importing a 3D Animation from 20-sim. First you build the 3D Animation in 20-sim with simple objects and make sure it is running correctly. Then you import the 3D Animation to Unity and use the power of Unity to create the Animation. Here we will show how this is done with the Scara Robot example model.

1. **Open 20-sim**.

2. From the **Examples\2D Mechanics** library drag and drop the **ScaraRobot** model.

3. Open the **Simulator** and **run** a simulation.

4. Put you mouse pointer on top of the **3D Animation** and from the right mouse menu select **Plot Properties**.
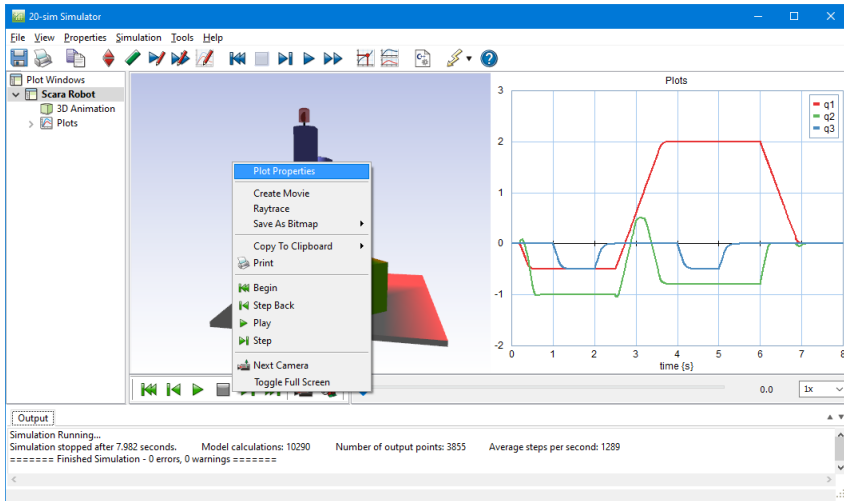

Opening the 3D Properties.

5. In the **3D Properties** from the **File** menu select **Save Scene**.

6. Click **Yes** to save the whole scenery.

7. Save the scenery in a location where you have read and write access using the name **ScaraRobot.scn.**

Now the 3D Animation is stored in a scenery file.
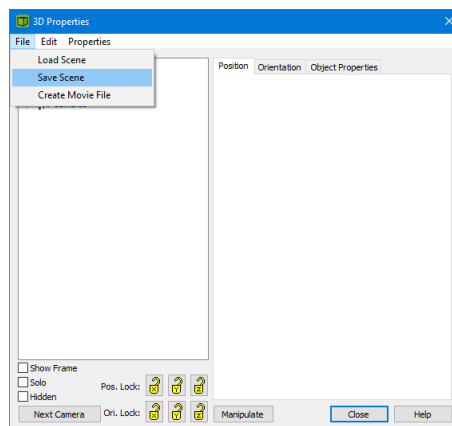

Opening the 3D Properties.

Import in Unity

The next job is to import the scenery file into Unity and create a Unity Animation.

8. Open **Unity**.

9. From the **GameObject** menu select **20-sim** and **20-sim Unity Toolbox**.

10. In the Hierarchy at the left select **20-sim Unity Toolbox**.

11. In the Inspector at the right go to 20-sim Unity Toolbox and **Import 20-sim Scenery File**.

12. Click the **Browse** button to find the scenery file **ScaraRobot.scn**.

13. Click the **Import 20-sim Scenery** button to import the scenery file.

The Scara Robot should now be visible in the scene at the center.
Importing a scenery file in Unity.

Building the Unity Animation

Now we could work on the scene and enrich it by adding all kind of GameObjects. We will leave this up to your own imagination. The final part of the job is to create a Unity Animation, generate an .fmu file and import this into 20-sim.

14. In the Hierarchy at the left select **20-sim Unity Toolbox**.

15. In the Inspector at the right go to 20-sim Unity Toolbox and **Build Unity Animation**.

16. Enter the **Export Location** (a folder where you have read and write access) and **Animation Name** (e.g. ScaraRobot) and click **Build Unity Animation**.

Importing the Unity Animation into 20-sim

17. Open 20-sim with the Scara Robot model.

18. Drag and drop the file **ScaraRbot.fmu** to the Editor.
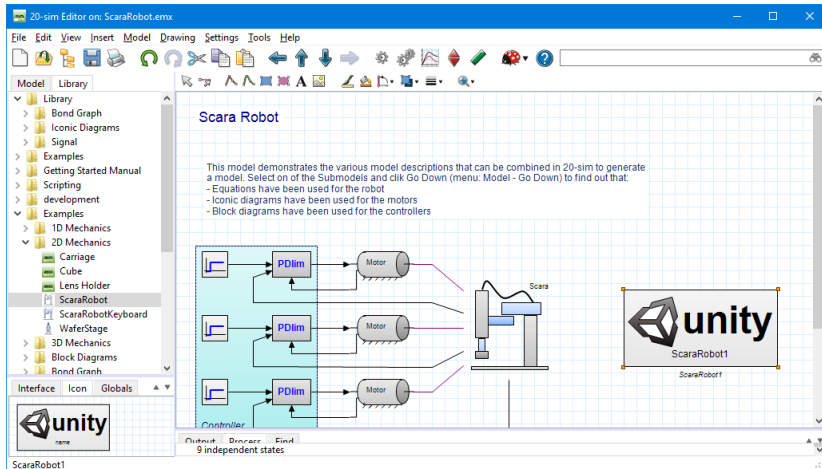

Connecting the FMU.

The Unity Animation does not have any inputs. It uses global variables to connect the simulation to the animation. Therefore we do not have to make connections.

Running the Unity Animation

When you simulate the 20-sim model, a Unity Animation will pop up and run with the simulation. Generally the simulation will be much too fast to follow. Therefore we must force the simulation to run in real-time.

19. In the Editor, from the **Model** menu select **Start Simulator**.

20. In the **Simulator** from the **Properties** Menu select **Run**.

21. In the Run Properties dialog click the **More** button and select **Attempting Realtime Simulation On**.

22. Click **Ok** to close the Run Properties dialog.

23. From the **Simulation** menu select **Run**.

Now you will see a Unity Animation window appear showing the Scara Robot moving.

24. Click **Alt-Enter** to change the Unity Animation from full screen to a window.

17.7 20-sim Inspector Properties

If the 20-sim Unity Toolbox is installed, any GameObject can be connected to the variables coming from a 20-sim simulation. The following object properties can specified.

Input / Output

* In most cases the variables that are calculated in 20-sim and epxorted to Unity. You can keep the Input/Output button to its default setting: *Input*.
* In some cases, however, a variable coming from Unity and exported to 20-sim. Then you have to set the Input/Output button to *Output*.

20-sim Coordinates / Unity Coordinates

When you add the 20-sim Toolbox to a GameObject, you can use 20-sim coordinates or Unity Coordinates:

* 20-sim uses a right-handed coordinate system for the position and rotation of objects.
* Unity uses a left-handed coordinate system frame.

Position / Rotation / Scale

You can couple 20-sim variables with the position, orientation and scale of objects, which works just like the position, orientation and scale of a 20-sim 3D Animation.

Scripting

In Unity you can create script in C# to tailor make GameObjects. If you choose the Scripting option in the 20-sim Variable section, you can connect 20-sim variables with the public member variables of your C# script.

17.8 Importing 3D Scenery

3D animations created in 20-sim can be exported to Unity. You first have to create a 20-sim model, simulate it and create a 3D Animation. From the 3D Animation, you can create a scenery file that can be imported in Unity:

1. In 20-sim go to the **Simulator** and put you **mouse pointer** on top of the **3D animation**.

2. From the **right mouse menu**, select **Plot Properties**.

3. In the Plot Properties window, select **File** - **Save Scene**.

Now you can open a Unity 3D project and install the 20-sim Unity Toolbox plug-in. When this is done properly, the Inspector at the left will show a **20-sim Unity Toolbox**.
You can now import the 20-sim 3D animation into your Unity project:

4. In the Inspector at the right go to the 20-sim Unity Toolbox and **Import 20-sim Scenery File**.

8. Click the **Browse** button to find the scenery file **ScaraRobot.scn**.

9. Click the **Import 20-sim Scenery** button to import the scenery file.

17.9 Generating the Unity Animation

In Unity when you select the 20-sim Unity Toolbox from the Hierachy at the left, a menu named **20sim unity Toolbox** (scripting) is visible in the Inspector at the right. You can use this menu to create a Unity Animation.
The 20-sim Unity Toolbox can create a standalone Unity application.

1. In the Export Location, choose the folder where you want to store the .fmu file with the Unity application.

2. In the **Animation Name** section enter the **file name** for the .fmu file.

3. Click on the **Build Unity Animation button**.

Now an .fmu file will be generated. You can drag and drop this file into your 20-sim model to run the animation.

17.10 Drag and Drop to 20-sim

Once you have created the .fmu file with the Unity application, you can drag and drop it to your 20-sim model.

1. Open your **20-sim** model.

2. **Drag and drop** the **.fmu file** from a File Explorer into the 20-sim Editor.

Scenery File

If the .fmu file was generated from an 20-sim 3D Animation using a scenery file, it will only run properly when dropped into the original 20-sim model.

Inputs

If the .fmu was created from scratch assigning variables to GameObjects, these variables will be inputs in the .fmu in 20-sim. You have to connect these inputs with the proper generators to get the animation working.

17.11 Running the Unity Animation

When you have inserted the .fmu file with the Unity application into 20-sim, you can start a simulation and the Unity Animation will appear. Generally the simulation will be much to fast. You have to force the simulation to run in real-time, to see a good result.

1. In the **20-sim Editor,** from the **Model** menu select **Start Simulator**.

2. In the **20-sim Simulator**, from the **Properties** menu select **Run**.

3. In the **Run Properties** window click the **More button**.

4. Set the **Attempting Realtime Simulation** button to **On** and click **OK**.
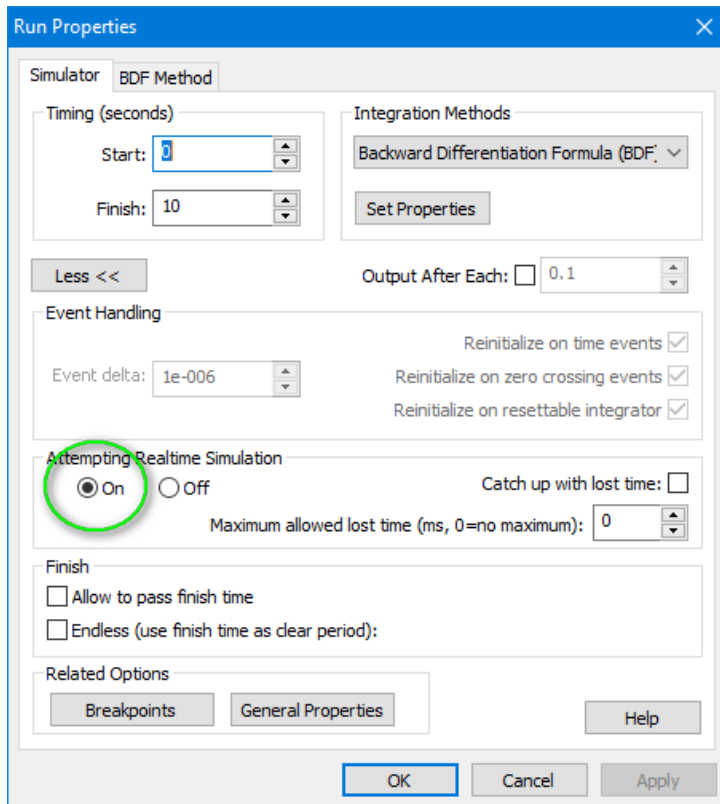

Make sure the simulation is set to realtime.

5.   In the **20-sim Simulator**, from the **Simulation** menu select **Run**.

Now Unity application will open and the simulation will start.

6.   Click **Alt-Enter** to change the Unity Animation from full screen to a window.

18 Scenario Manager

18.1 Introduction

Introduction

Scripting is very useful to run tasks automatically but they are not very user friendly and intuitive for users with little knowledge of scripting languages. The Scenario Manager fills this gap. You can use it to add actions (basic scripting functions) into a scenario (a set of actions) and run that automatically, without any knowledge of scripting languages.

The Scenario Manager can be used to run all kinds of tasks automatically:

- Change all kinds of model settings and run simulations (experiments)
- Check simulation outputs against pre-defined results (test automation)
- Run simulations and store the results on file (data storage)
- Generate C-code of submodels (code generation)

How does the Scenario Manager Work?

When you have a model ready for testing, you can open the Scenario Manager.

1. From the **Tools menu** select **Scenario Manager**.

2. Click on **Scenario1**.

Now you will see an empty Scenario Manager with Scenario1 selected:
The Pre-simulation bar, Simulation bar and Post-simulation bar allow you to add Actions. Actions in the Pre-Simulation bar will be carried out before the model is simulated. Actions in the Simulation bar will be carried out during a simulation. Actions in the Post-Simulation bar will be carried out after the model is simulated.

3. Click on the **Pre-simulation bar**, the **Simulation bar** or the **Post-simulation bar** to add Actions.
Under the bar a list of Actions is presented. If you click on an Action, it will be added to the bar.

4. Click on the **Action** to see its **Properties** at the right
You can set the Properties for the selected Action at the left. If you click on the Recycle Bin button at the top left, the Action will be removed from the bar.

Scenario

A set of Actions is called a Scenario. You may change the name of the Scenario in the tree at the left. If you select a Scenario in the tree, you can run it by clicking the **Play** button (white circle with black triangle) at the top middle.
Category

A Category may contain a set of Scenarios. You may change the name of the Category in the tree at the left. If you select a Category in the tree, and click the **Play** button (white circle with black triangle) at the top middle, all Scenarios in the Category will be run.
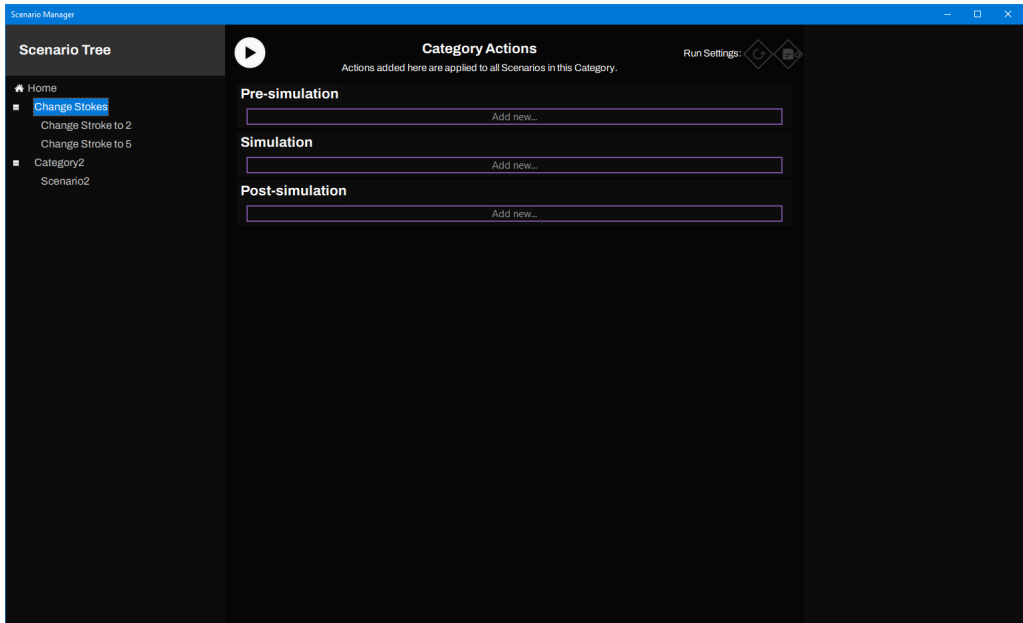

As you can see, the Pre-simulation bar, Simulation bar and Post-simulation bar have different color when a Category is selected. If you add an Action, this action will be present for all Scenarios under the Category. This is very useful if you have Actions that have to repeat for every Scenario.

Learn More

To learn more about the Scenario Manager:

1. Run the example model to see how it all works.

2. See which Actions can be used.

3. Inspect the results of an Action, using the logs.

4. Reset the changes made during a Scenario.

5. See where the Scenarios are stored on file.

Tips

You can use the Scenario Manager for a number of tasks. Here are some examples:

1. Run a simulation a number of seconds: You can run a simulation for a certain time by executing the Modules: **Start Simulation** - **Wait for seconds** - **Stop Simulation**.

2. Compare a simulation output with a previously recorded output: You can log a variable during a simulation with the module **Log Variables**, store it in a .csv-file with the Module **Generate CSV** and then use the Module **Compare CSV** to compare this value with a previously recorded value.

3. Unit Testing: Insert a model from a library with the **Update Submodel** Module and then run a test.

4. Parameter Sweep: Set a parameter value and compare the simulation output with a previous run.

5. Test Automation: Defined the desired output of a simulation run and compare this with the real simulation output using an Assert model.

- Change all kinds of model settings and run simulations (experiments)
- Check simulation outputs against pre-defined results (test automation)
- Run simulations and store the results on file (data storage)
- Generate C-code of submodels (code generation)

18.2 Example

Introduction

You can see the toolbox in action with the example model *Lifting System - Test Automation.* We will run this model tow show you how the Scenario Manager can be used.

Editor

1. In the 20-sim **Editor** go to the **Library** tab

2. In the Library tab select **Examples** - **Signal Processing** - **Lifting System - Test Automation**.

3. **Drag and drop** the model to the right to open the model.

Now the Editor will look like:
As you can see, in the model two AssertSignal blocks have been added.

• AssertSignal1 (Continuous): compares the actual position with the setpoint position. If both deviate more that 5 cm, the output *testResult* goes from true to false.

• AssertSignal2 (Boolean): The minimum value of the presssures in both chambers is compared with a constant signal of 5 bar. If any one of the pressures is lower, the output of the AssertSignal2 block *testResult* goes from true to false.

We will use the two AssertSignal blocks to veryfy the outcomes of several Scenarios in the Scenario Manager.

Scenario Manager

Now we will open the Scenario Manager and run some scenarios:

1. From the **Tools menu** select **Scenario Manager**.

2. Select **Proportional Gains**.

The Scenario Manager will look like:
Category

At the left in the Scenario Manager you will see a tree with Categories and Scenarios. Categories are listed directly under Home. In the picture above you see the category *Proportional Gains*, the Category *Valve Settings and the* Catergory *Failing Tests*. Under the Categories, the Scenarios are listed (kp = 4 etc, kp = 5, kp = 6, Gleak = 1e-14 etc.).

In the middle of the Scenario Manager, you can see the various Actions that have been selected. Each Action will perform a certain task. Actions are carried out sequentially, from the left to the right, and from the top to the bottom. In the picture above, the category *Proportional Gains* is selected. The *Actions* that apply for this Category are indicated in purple:

- Pre-simulation: The Actions that are shown here, are carried out before the simulation. In the picture above no Actions have been selected.
- Simulation: The Actions that are shown here, are carried out during the simulation. In the picture above the Actions *Run Simulation* and *OK to Continue* are shown.
- Post-simulation: The Actions that are shown here, are carried after a simulation. In the picture above the two Actions *AssertTest* are shown.

Scenario

3. Select **kp = 4**.

Now the Scenario Manager will look like:
As you can see, the Pre-simulation bar shows one Action extra, *Set Parameter*. The color of the Actions is blue.

- Actions from a Category are shown in purple.
- Actions from a Scenario are shown in blue.
- When running a scenario, all Actions will be executed.

In the Scenario of the picture above a parameter value will be set, the a simulation will be run followed by asking the user to press OK and then check the output of the AssertSignal modules.

Running a Category

4. Open the 20-sim Simulator: In the 20-sim Editor click **Model** - **Start Simulator**.

5. Move the **Simulator** window on aside from the **Scenario** Manager window, so you can **see both**.

6. In the Scenario Manager choose the Category **Proportional Gains**

7. Click on the **Play** button .

Now the first scenario of this Category will be run. In the Simulator window you can see the simulation run:
8.   Press **OK** after each run.

After the three runs have been performed, the Scenario Manager will look like:
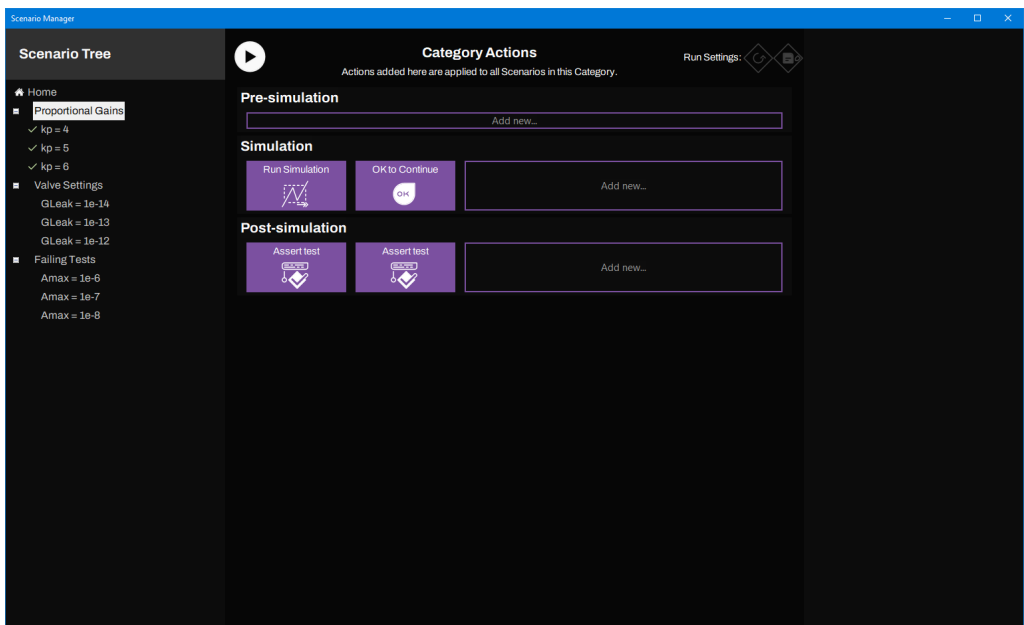

Left of the Scenarios, you will see V-signs indicating that the Scenarios were run succesfully: the AssertSignal blocks have given a **true** output at the end of each run.

9.   In the Scenario Manager choose the Category **Valve Settings**.

10. Click on the **Run category** button**.**

Now three Scenarios will be run without asking you to click OK. Left of the Scenarios, you will see V-signs indicating that the tests were successful.

11. In the Scenario Manager choose the Category **Failing Tests**

12. Click on the **Run category** button**.**

Left of the Scenarios, you will see red crosses, indicating that the tests were not successful: the AssertSignal blocks have given a **false** output at the end of each run.

Running a Scenario

You can also run a Scenario individually.

13. In the Scenario Manager choose the Scenario **Amax = 1e-8**

14. Click on the **Play** button**.**

Now the Scenario will run. After the Scenario has been run, one of the Actions has a red edge. If you click on the Action, you will see the corresponding log. It will show that a time = 0.16 s the simulation output was deviating too much from the desired value.
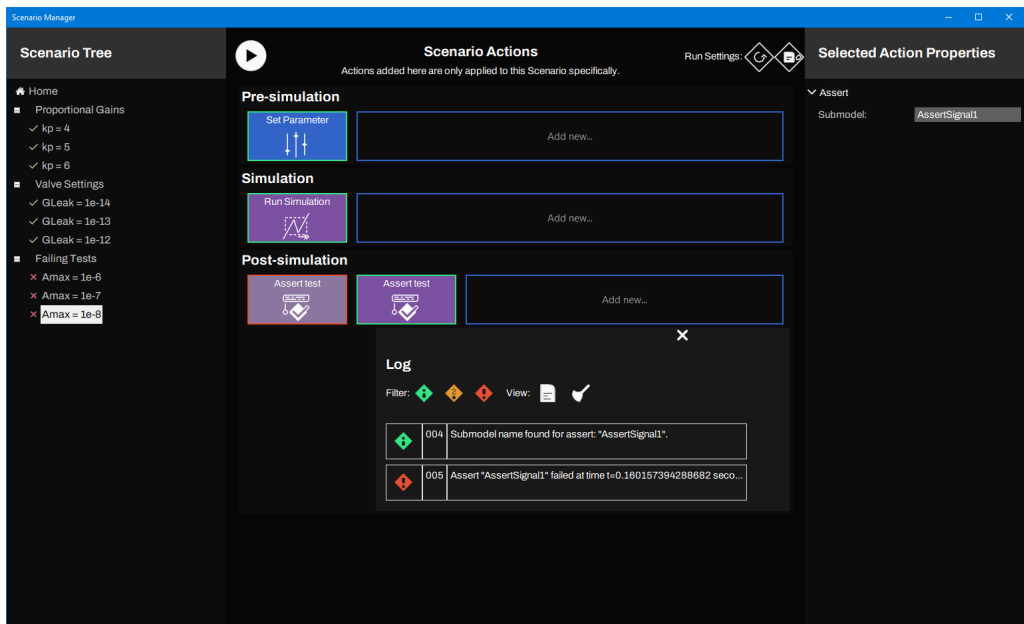

Inspecting a Module

You can inspect a module by clicking on it.

15. In the Scenario Manager **click** on the Module **Set Parameter**.

Now the Scenario Manager will look like:
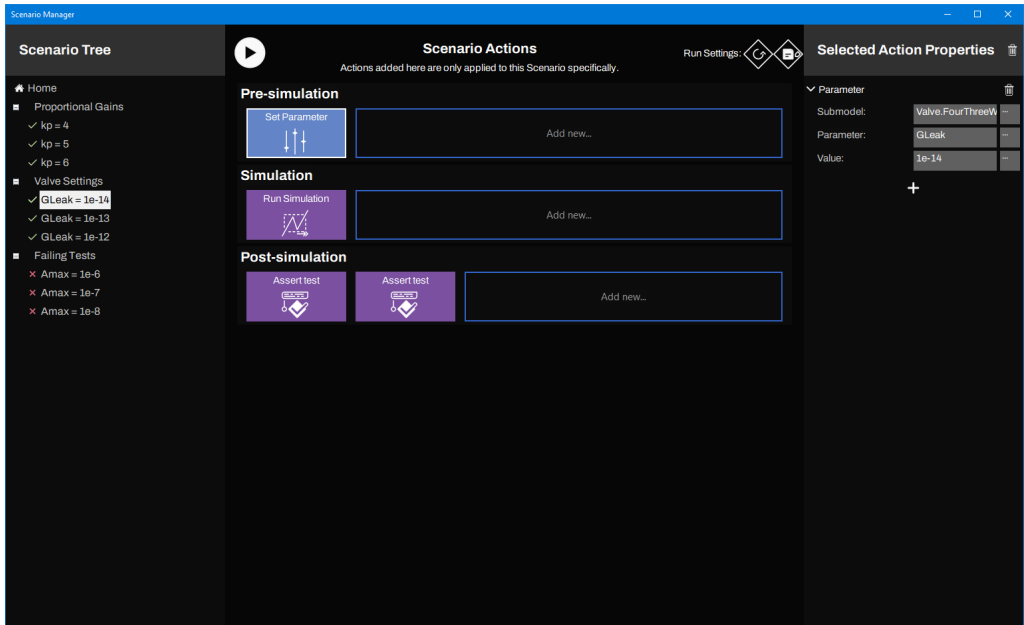

At the right of the Scenario manager, you can see the settings of this Action. It will set the parameter of the 20-sim model to a certain value. By clicking on the pencil buttons, you can change the settings.

18.3 Actions

The following Actions are available in the Scenario Manager.

Pre-simulation

- **Add Plot Window**: Create a new plot in 20-sim and show variables.
- **Generate Code**: Create C-code from a 20-sim model.
- **Implementation**: Change the implementation of a submodel.
- **Log Variables**: Log a variable in memory during a simulation run.
- **OK to Continue**: Ask the user to click OK to continue.
- **Set Parameter**: Change the value of a parameter.
- **Simulator Setting:** Change the settings of the Simulator: Fast mode, Endless mode, Start time, Finish Time, Event Delta, Output after each, Integration method.
- **Update Submodel**: Exchange a submodel in your model with a submodel from file.

Simulation

- **Generate Code**: Create C-code from a 20-sim model.
- **Generate CSV**: Store the variables that have been logged on a .csv-file.
- **Log Variables**: Log a variable in memory during a simulation run.
- **OK to Continue**: Ask the user to click OK to continue.
- **Run Simulation**: Run a simulation from start time to finish time. If the finish time is passed, the simulation will stop, even if endless simulation has been chosen. After passing the finish time the next Module will be executed.
- **Set Parameter**: Change the value of a parameter.
- **Simulator Setting:** Change the settings of the Simulator: Fast mode, Endless mode, Start time, Finish Time, Event Delta, Output after each, Integration method.
- **Start Simulation**: Start a simulation run and execute the next module. The simulation will stop when all Modules have been executed or the Stop Simulation Module is executed.
- **Stop Simulation**: Stop a running Simulation.
- **Update Submodel**: Exchange a submodel in your model with a submodel from file.
- **Wait for Seconds**: Wait a number of second before executing the next Module.

Post-simulation

- **Assert Test**: This Module will ask you to select a submodel. It will look inside this submodel for a boolean output signal testResult. If this signal is true at the end of the simulation run, the test was successful and a V-sign is placed next to the scenario, otherwise a red cross will be placed.
- **Compare CSV**: Compare the values in two .csv-files.
- **Generate Code**: Create C-code from a 20-sim model.
- **Generate CSV**: Store the variables that have been logged on a .csv-file.
- **Implementation**: Change the implementation of a submodel.
- **OK to Continue**: Ask the user to click OK to continue.
- **Set Parameter**: Change the value of a parameter.

18.4 Action Logs

With the Logging Active button displayed:

logging will be active during the running of the Scenario. After a run is complete, you can inspect the log, by clicking on an Action. Now the log of that Action will be displayed below the Action.
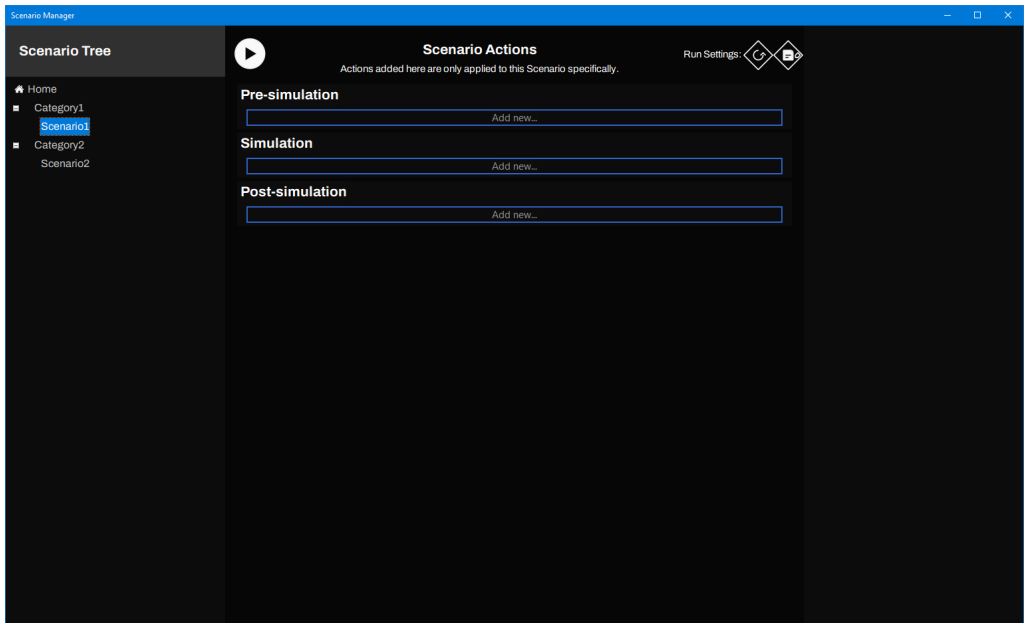

Inspecting the log is useful to see if an action was carried out properly. If an Action fails (e.g. file cannot be found, no writing permission,..), the cause will be displayed in the log.

18.5 Reset Model

With the Reset Model button displayed:

all changes made to a model, during a scenario, will be reset after the scenario has been run. This very useful if you do not want to mess up you model, but sometimes unwanted. Uncheck this button, if you want to keep the changes made to the model.

18.6 File Storage

File Locations

All settings for the Scenario Manager are stored in a folder named *Scenario Manager* with the same folder as the 20-sim model. Suppose you have stored a 20-sim model as:

```
C:\temp\models\my 20sim model.emx
```

Then the Scenario Manager files are stored in the folder:

```
C:\temp\models\ScenarioManager\my20simmodel\
```

Inside this folder you will find a log file

```
C:\temp\models\ScenarioManager\my20simmodel\build_server_log.txt
```

Inside the log file you can see the outcomes of the Scenarios that have been run.

Copies

If you want to copy the Scenario Manager with a 20-sim model, make sure that you copy the folder

```
ScenarioManager\my20simmodel\
```

with the 20-sim model.

Index

20-sim is a modeling and simulation program that runs under Microsoft Windows. With 20-sim you can simulate the behavior of dynamic systems, such as electrical, mechanical and hydraulic systems or any combination of these.

20-sim fully supports graphical modeling, allowing to design and analyze dynamic systems in a intuitive and user friendly way, without compromising power. 20-sim supports the use of components. This allows you to enter models as in an engineering sketch: by choosing components from the library and connecting them, your engineering scheme is actually rebuilt, without entering a single line of math!
